

Ibuprofen Synthesis

Introduction

Kinetic analysis of catalytic reactions is essential for understanding rate behavior as well as the reaction mechanism. Developing knowledge of intrinsic reaction kinetics and of rate equations is central to reaction engineering studies aimed at improving reactor design.

This example illustrates the reaction kinetics of a complex chemistry occurring in a perfectly stirred tank reactor. The homogeneous catalysis of 1-(4-isobutylphenyl) ethanol into the anti-inflammatory drug ibuprofen serves as the example chemistry. The model determines concentrations of reactants, intermediates, and products as functions of time for the network of chemical reactions.

The chemistry in this example involves homogeneous catalysis. As this terminology suggests, the catalyst and the reacting species are in the same phase. Most commonly, a liquid reaction mixture contains a soluble metalorganic complex that affects the catalysis. Organometallic catalysts can often be fine-tuned with respect to reaction activity and selectivity. Because these relatively expensive catalysts produce highly-refined reaction products, they commonly find application in fine chemicals or pharmaceutics.

The model focuses on the use of the Chemical Reaction Engineering Module for a kinetics investigation. You easily enter chemical reaction formulas from the keyboard, then the Reaction Engineering interface automatically generates rate expressions and material balances. It solves the equations, and you postprocess results directly in the COMSOL Desktop.

Model Description

Analyzing chemical kinetics involves solving the set of ordinary differential equations corresponding to individual steps in a network of reactions. This example illustrates the kinetics of ibuprofen synthesis. Figure 1 shows the reaction steps displayed in a catalytic cycle (Ref. 1).

$$\begin{array}{c} \text{OH} \\ \text{L}_2\text{PdCl}_2 \\ \text{H}_2\text{O} \\ \text{H}_2\text{O} \\ \text{COClPdL}_2 \\ \text{CI} \\ \text{CO} \\ \text{CO$$

Figure 1: Catalytic cycle of ibuprofen synthesis.

Prior to entering the cycle, the starting material, 1-(4-isobutylphenyl)ethanol, is first dehydrated to form 4-isobutylstyrene. This species subsequently undergoes the addition of HCl to produce the active substrate 1-(4-isobutylphenyl)ethyl chloride. The palladium catalyst must also go through an initial transformation, from L_2PdCl_2 (L=triphenylphosphine) to anionic L_2PdCl , before becoming active. The activated catalyst then assists in the carbonylation and hydrolysis of 1-(4-isobutylphenyl)ethyl chloride, producing ibuprofen.

The following reactions represent the catalytic cycle:

$$+ H^{+} + Cl^{-} \xrightarrow{k_{2}} Cl$$

$$(2)$$

$$Cl$$
 + B k_3 + H⁺ + Cl⁻ + B (3)

$$L_2PdCl_2 + CO + H_2O \xrightarrow{k_4} L_2PdCl^7 + Cl^- + 2H^+ + CO_2$$
 (4)

$$L_{2}PdCl^{7} + Cl \qquad k_{5} \qquad L_{2}PdCl_{2}$$

$$(5)$$

$$L_2PdCl_2$$
 + CO k_6 $L_2PdClCO$ + Cl (6)

$$L_2 PdClCO + H_2 O \xrightarrow{k_7} COOH + H^+ + L_2 PdCl^{-1}$$
 (7)

Reaction 1 involves the dehydration of the reactant alcohol to form the corresponding alkene. Reaction 2 describes the hydrohalogenation of alkene, resulting in the active substrate 1-(4-isobutylphenyl)ethyl chloride. Reaction 3 shows the dehydrohalogenation of the active substrate, assisted by a base, B. Reaction 4 describes the transformation of the precatalytic species L₂PdCl₂ into the active anionic catalyst L₂PdCl. In Reaction 5 the active substrate undergoes oxidative addition to the L₂PdCl catalyst. Reaction 6 summarizes the carbonylation, and Reaction 7 describes the hydrolysis of the metalorganic species, leading to the formation of ibuprofen and regeneration of the catalyst.

In order to make species notation more manageable, this example uses the following labels:

species abbreviation species abbreviation
$$COOH$$
 roh $COOH$ ibu $COOH$ ibu

Making use of these notations, the reaction rates corresponding to Reaction 1 through Reaction 7 are:

$$r_1 = k_1 c_{\text{roh}} c_H \tag{8}$$

$$r_2 = k_2 c_{\text{ren}} c_H c_{Cl} \tag{9}$$

$$r_3 = k_3 c_{\text{rhcl}} c_B \tag{10}$$

$$r_4 = k_4 c_{\rm pd1} c_{CO} c_{H_2O} \tag{11}$$

$$r_5 = k_5 c_{\rm pd2} c_{\rm rhcl} \tag{12}$$

$$r_6 = k_6 c_{\rm pd3} c_{CO} \tag{13}$$

$$r_7 = k_7 c_{\rm pd4} c_{H_2O} \tag{14}$$

The Reaction Engineering interface automatically generates these expressions and displays them immediately when you enter the chemical reaction formulas. By default, the software assumes that the chemistry takes place isothermally in a perfectly stirred batch reactor.

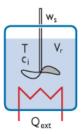

Figure 2: A perfectly stirred batch reactor where the reactant alcohol is carbonylated to form ibuprofen by means of palladium catalysis.

With no inflow or outflow from the reactor, the change of species concentrations with time is a function only of the reaction rates:

$$\frac{dc_i}{dt} = \sum_{j=1}^{n_r} v_{ij} r_j \tag{15}$$

The Reaction Engineering automatically generates the mass balance in Equation 15 for each of the species, i, in the reactions, j, accounting for the stoichiometry in the reaction formulas, v, and solves these equations.

The model investigates two reaction conditions. The first simulation (Case 1) solves for the seven reaction displayed previously. In Case 2 you modify the reaction network with an additional reaction, altering the simulation results. Assume that the reactant alcohol and product ibuprofen (a carboxylic acid) react reversibly, forming an ester:

The results of the two simulations are compared to gain insight in the process implications.

CASE I

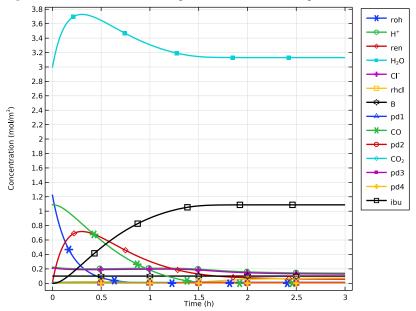

Figure 3: Species concentrations (mol/m³) as a function of time (s).

Clearly, after approximately two hours the process has run to completion.

CASE 2

This expansion of the original case adds a reversible reaction between the reactant alcohol and the product ibuprofen to form an ester. Figure 4 shows the concentration transients.

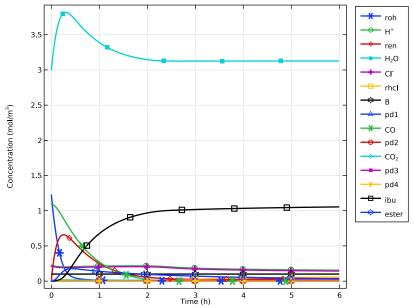

Figure 4: Species concentrations (mol/m^3) as a function of time (s).

In the course of the reaction, ester forms as an intermediary product. In order to achieve the same final concentration of ibuprofen for Case 2 as in Case 1, the process must run for at least 12 hours.

In conclusion, this example illustrates the use of the Chemical Reaction Engineering Module for analyzing the kinetics of a complex reaction network. When you enter the chemical-reaction formulas into the physics interface, the Reaction Engineering interface automatically sets up the corresponding rate expressions and material balances. You can modify simulation conditions effortlessly, for instance by activating/deactivating individual reactions or by changing initial conditions.

Application Library path: Chemical Reaction Engineering Module/

Ideal_Tank_Reactors/ibuprofen_synthesis

Modeling Instructions

From the File menu, choose New.

NEW

In the New window, click Model Wizard.

MODEL WIZARD

- I In the Model Wizard window, click 0D.
- 2 In the Select Physics tree, select Chemical Species Transport>Reaction Engineering (re).
- 3 Click Add.
- 4 Click Study.
- 5 In the Select Study tree, select General Studies>Time Dependent.
- 6 Click M Done.

GLOBAL DEFINITIONS

Start by reading in a set of global parameters.

Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.
- 3 Click Load from File.
- 4 Browse to the model's Application Libraries folder and double-click the file ibuprofen_synthesis_parameters.txt.

First, set up the model for the first case.

REACTION ENGINEERING (RE)

- I In the Model Builder window, under Component I (compl) click Reaction Engineering (re).
- 2 In the Settings window for Reaction Engineering, click to expand the Mixture Properties section.
- 3 From the Phase list, choose Liquid.

Reaction I

- I In the Reaction Engineering toolbar, click A Reaction.
- 2 In the Settings window for Reaction, locate the Reaction Formula section.
- 3 In the Formula text field, type roh+H+=>ren+H20+H+.
- 4 Locate the Rate Constants section. In the $k^{\rm f}$ text field, type kreac 1.

Reaction 2

- I In the Reaction Engineering toolbar, click _ Reaction.
- 2 In the Settings window for Reaction, locate the Reaction Formula section.
- 3 In the Formula text field, type ren+H++Cl-=>rhcl.
- **4** Locate the **Rate Constants** section. In the k^{f} text field, type kreac 2.

Reaction 3

- I In the Reaction Engineering toolbar, click ___ Reaction.
- 2 In the Settings window for Reaction, locate the Reaction Formula section.
- 3 In the Formula text field, type rhcl+B=>ren+H++Cl-+B.
- **4** Locate the **Rate Constants** section. In the k^{f} text field, type kreac_3.

Reaction 4

- I In the Reaction Engineering toolbar, click ___ Reaction.
- 2 In the Settings window for Reaction, locate the Reaction Formula section.
- 3 In the Formula text field, type pd1+C0+H20=>pd2+C1-+2H++C02.
- 4 Locate the Rate Constants section. In the $k^{\rm f}$ text field, type kreac 4.

Reaction 5

- I In the Reaction Engineering toolbar, click ___ Reaction.
- 2 In the Settings window for Reaction, locate the Reaction Formula section.
- 3 In the Formula text field, type pd2+rhc1=>pd3.
- 4 Locate the Rate Constants section. In the $k^{\rm f}$ text field, type kreac 5.

Reaction 6

- I In the Reaction Engineering toolbar, click ___ Reaction.
- 2 In the Settings window for Reaction, locate the Reaction Formula section.
- 3 In the Formula text field, type pd3+C0=>pd4+C1-.
- 4 Locate the Rate Constants section. In the $k^{\rm f}$ text field, type kreac 6.

Reaction 7

- I In the Reaction Engineering toolbar, click A Reaction.
- 2 In the Settings window for Reaction, locate the Reaction Formula section.
- 3 In the Formula text field, type pd4+H20=>pd2+H++ibu.
- **4** Locate the **Rate Constants** section. In the k^{f} text field, type kreac_7.

Reaction 8

- I In the Reaction Engineering toolbar, click A Reaction.
- 2 In the Settings window for Reaction, locate the Reaction Formula section.
- 3 In the Formula text field, type ibu+roh+H+<=>ester+H2O+H+.
- 4 Click Apply.
- **5** Locate the **Rate Constants** section. In the $k^{\mathbf{f}}$ text field, type kfreac_8.
- **6** In the $k^{\mathbf{r}}$ text field, type krreac_8.

Initial Values 1

- I In the Model Builder window, click Initial Values I.
- 2 In the Settings window for Initial Values, locate the Volumetric Species Initial Values section.
- **3** In the table, enter the following settings:

Species	Concentration (mol/m^3)
В	cB_0
СО	cCO_0
Cl-	cClion_0
H+	cHion_0
H2O	cH20_0
pdl	cpd1_0
roh	croh_0

CASE I

Run case 1, which only includes reactions 1-7, for three hours.

- I In the Model Builder window, click Study I.
- 2 In the Settings window for Study, type Case 1 in the Label text field.

Step 1: Time Dependent

I In the Model Builder window, under Case I click Step I: Time Dependent.

- 2 In the Settings window for Time Dependent, locate the Study Settings section.
- 3 From the Time unit list, choose h.
- 4 In the Output times text field, type range (0,0.1,3).
 - Now, disable reaction 8 and the participating ester.
- 5 Locate the Physics and Variables Selection section. Select the Modify model configuration for study step check box.
- 6 In the tree, select Component I (compl)>Reaction Engineering (re)>8: ibu + roh + H+ <=> ester + H20 + H+
- 7 Right-click and choose **Disable**.
- 8 In the tree, select Component I (compl)>Reaction Engineering (re)>Species: ester.
- 9 Right-click and choose Disable.
- 10 In the Home toolbar, click **Compute**.

RESULTS

Case I - Concentrations

- I In the Settings window for ID Plot Group, type Case 1 Concentrations in the Label text field.
- 2 Click to expand the **Title** section. From the **Title type** list, choose **None**.
- 3 Locate the Legend section. From the Layout list, choose Outside graph axis area.

Global I

- I In the Model Builder window, expand the Case I Concentrations node, then click Global I.
- 2 In the Settings window for Global, click to expand the Coloring and Style section.
- **3** From the **Width** list, choose **2**.
- 4 Find the Line markers subsection. From the Marker list, choose Cycle (reset).
- 5 In the Number text field, type 5.
- 6 Click to expand the Legends section. From the Legends list, choose Manual.
- 7 In the table, enter the following settings:

Legends
roh
H ⁺
ren

Legends
H ₂ 0
Cl ⁻
rhcl
В
pd1
CO
pd2
CO ₂
pd3
pd4
ibu

The plot in the **Graphics** window should look like that in Figure 3.

Next, create a plot that only includes the product, starting material and intermediate species.

Case I - Concentrations, Product and Intermediates

- I In the Home toolbar, click Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Case 1 Concentrations, Product and Intermediates in the Label text field.
- 3 Locate the Title section. From the Title type list, choose None.
- 4 Locate the Plot Settings section. Select the Two y-axes check box.
- 5 Locate the Legend section. From the Position list, choose Middle right.

Global I

- I In the Case I Concentrations, Product and Intermediates toolbar, click (Global.
- 2 In the Settings window for Global, locate the y-Axis Data section.
- 3 Click \ Clear Table.
- **4** In the table, enter the following settings:

Expression	Unit	Description
re.c_roh	mol/m^3	Concentration
re.c_ren	mol/m^3	Concentration

Expression	Unit	Description
re.c_rhcl	mol/m^3	Concentration
re.c_ibu	mol/m^3	Concentration

- 5 Locate the Coloring and Style section. From the Width list, choose 2.
- 6 Locate the Legends section. From the Legends list, choose Manual.
- 7 In the table, enter the following settings:

Legends
roh
ren
rhcl
ibu

Case I - Concentrations, Product and Intermediates

In the Case I - Concentrations, Product and Intermediates toolbar, click (Global.

Global 2

- I In the Settings window for Global, locate the y-Axis Data section.
- 2 Click \ Clear Table.
- **3** In the table, enter the following settings:

Expression	Unit	Description
re.c_pd3	mol/m^3	Concentration
re.c_pd4	mol/m^3	Concentration

- 4 Locate the Coloring and Style section. From the Width list, choose 2.
- 5 Locate the Legends section. From the Legends list, choose Manual.
- **6** In the table, enter the following settings:

Legends
pd3
pd4

Case I - Concentrations, Product and Intermediates

- I In the Model Builder window, click Case I Concentrations, Product and Intermediates.
- 2 In the Settings window for ID Plot Group, locate the Plot Settings section.
- 3 In the table, select the Plot on secondary y-axis check box for Global 2.

4 In the Case 1 - Concentrations, Product and Intermediates toolbar, click Plot.

Continue with the model for case 2.

ADD STUDY

Run case 2 for six hours, now including reaction 8.

- I In the Home toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select General Studies> Time Dependent.
- 4 Click Add Study in the window toolbar.

CASE 2

- I In the Model Builder window, click Study 2.
- 2 In the Settings window for Study, type Case 2 in the Label text field.

Steb 1: Time Dependent

- I In the Model Builder window, under Case 2 click Step I: Time Dependent.
- 2 In the Settings window for Time Dependent, locate the Study Settings section.
- 3 From the Time unit list, choose h.
- 4 In the Output times text field, type range (0,0.1,6).
- 5 In the Home toolbar, click **Compute**.

RESULTS

Case 2 - Concentrations

- I In the Settings window for ID Plot Group, type Case 2 Concentrations in the Label text field.
- 2 Locate the Data section. From the Dataset list, choose Case 2/Solution 2 (sol2).
- 3 Locate the Title section. From the Title type list, choose None.
- 4 Locate the Legend section. From the Layout list, choose Outside graph axis area.

Global I

- I In the Model Builder window, expand the Case 2 Concentrations node, then click Global I.
- 2 In the Settings window for Global, locate the Coloring and Style section.
- 3 From the Width list, choose 2.

- 4 Find the Line markers subsection. From the Marker list, choose Cycle (reset).
- 5 In the Number text field, type 5.
- 6 Locate the Legends section. From the Legends list, choose Manual.
- 7 In the table, enter the following settings:

Legends
roh
H ⁺
ren
H ₂ 0
Cl ⁻
rhcl
В
pd1
CO
pd2
CO ₂
pd3
pd4
ibu
ester

8 In the Case 2 - Concentrations toolbar, click Plot.

Compare the plot in the **Graphics** window with that in Figure 4.

Again, create a new plot with the product, starting material and intermediate species for case 2.

Case I - Concentrations, Product and Intermediates

In the Model Builder window, under Results right-click Case I - Concentrations, Product and Intermediates and choose Duplicate.

Case 2 - Concentrations, Product and Intermediates

- I In the Model Builder window, under Results click Case I Concentrations, Product and Intermediates 1.
- 2 In the Settings window for ID Plot Group, type Case 2 Concentrations, Product and Intermediates in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Case 2/Solution 2 (sol2).

Global I

- I In the Model Builder window, expand the Case 2 Concentrations, Product and Intermediates node, then click Global I.
- 2 In the Settings window for Global, locate the y-Axis Data section.
- **3** In the table, enter the following settings:

Expression	Unit	Description
re.c_ester	mol/m^3	Concentration

4 Locate the **Legends** section. In the table, enter the following settings:

Legends	
roh	
ren	
rhcl	
ibu	
ester	
•	

5 In the Case 2 - Concentrations, Product and Intermediates toolbar, click Plot.
