

# Evaporation of Ethanol and Water from a Wine Glass

Wine shows are events that involve trying and judging different wines. When this is performed formally, the samples that are not assessed immediately are covered to avoid exposure to air. The air exposure would lead to evaporation of, for example, ethanol from the wine, which would affect the tasting experience. Occasionally, the event may involve more than 30 different samples of wine, where the wine is poured prior to judging. If the samples are uncovered, the latter ones will have been exposed for air for a longer time than the first ones. Inspired by the paper Wollan and others (Ref. 1), this model simulates the evaporation and transport of ethanol and water from a wine glass into an ambient air domain. Four different compositions in terms of the alcohol by volume are solved for: 0.01, 0.15, 0.4, and 0.99. Evaporation of multiple species from a nonideal liquid mixture is modeled using the Vapor-Liquid Interface feature. Evaporation at the liquid surface induces free convection in the surrounding vapor phase, both due to the change in composition and due to the heat of vaporization. The model is set up in a 2D axially symmetric model using coupled Laminar Flow, Transport of Concentrated Species in Vapor, and Heat Transfer in Fluids interfaces. Accurate thermodynamic data are provided by the Thermodynamics functionality.

# Model Definition

The model geometry consists of a partially filled wine glass, placed on a table, and surrounded by a gas phase domain, which is initially filled with air. The relative humidity in the air domain is set to 30%, a value typical of indoor environments, and the temperature to 23°C. The regular geometry of the glass allows for a 2D axially symmetric geometry to be used (see Figure 1). The specific chemical composition of different wines varies, but in this model, it is assumed that only ethanol and water are present in the liquid. Evaporation of both species is accounted for by computing the equilibrium vapor phase mole fractions, and applying them at the liquid surface. The Reacting Flow multiphysics interface is used to solve for coupled fluid flow, mass transport, and heat transfer in the vapor region inside of the glass and around it. Heat transfer by conduction is solved for in the glass and the table. Assuming that the influence of convection in the liquid is small, it is assumed stationary and subjected to heat transfer by conduction only. In order to study how the alcohol content influences the evaporation, four different liquid compositions characterized by the alcohol by volume (abv): 0.01, 0.15, 0.4, and 0.99, are solved for.

An abv of 0.01 implies that out of the total liquid volume, 1% is ethanol and the 99% is water.

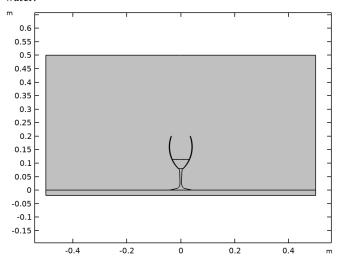

Figure 1: The model geometry, a wine glass placed on a table in a domain initially filled with air at a relative humidity of 30%.

# VAPOR-LIQUID EQUILIBRIUM

To model the evaporation of ethanol and water from the glass of wine, the vapor-liquid equilibrium at the surface of the beverage must be described. The condition of thermodynamic equilibrium for a species i is given by

$$f_i^{\mathrm{L}}(T, p, \omega_{l,i}) = f_i^{\mathrm{V}}(T, p, \omega_{n,i}) \tag{1}$$

where  $f_i^L$  is the liquid phase fugacity and  $f_i^V$  is vapor phase fugacity. The fugacities in each phase depend on the temperature and pressure, T and p, as well as the mass fraction in the liquid phase,  $\omega_{l,i}$ , and the mass fraction in the vapor phase,  $\omega_{v,i}$ , respectively.

The thermodynamic functions for fugacity  $f_i$  (= $f_i^L$ = $f_i^V$ ) will be created automatically when all species are coupled to a Thermodynamics system. With the assumption of  $f_i$  being equal to  $p_{\mathrm{eq},i}$ , the molar concentration ( $c_{\mathrm{eq},i}$ ) can be expressed as

$$c_{\text{eq},\,i} = \frac{p_{\text{eq},\,i}}{RT} \tag{2}$$

where R is the ideal gas constant, 8.314 J/(mol·K).

The mass fraction at the vapor-liquid surface at equilibrium is

$$\omega_{0,i} = \frac{p_{\text{eq},i} M_i}{\rho} \tag{3}$$

This is the boundary condition at the vapor-liquid surface under the Transport of Concentrated Species in Vapor.

### MODELING EVAPORATION

In the model, the mass fraction of ethanol and water vapor are prescribed at the vapor-liquid interface using Equation 3. This sets up diffusive transport of each species to or from the surface. The ethanol concentration in the vapor is initially zero implying that ethanol is transported from the surface into the vapor phase. To account for the assumption that the liquid surface does not move due to the evaporation, the fluid velocity normal to the surface is defined from the Stefan velocity

$$\rho u_{s} = \mathbf{n} \cdot \sum_{i} (\mathbf{j}_{i} + \rho u_{s} \omega_{i} \mathbf{n})$$
(4)

Here, the sum on the right-hand side contains the total mass flux of all species for which the mass fraction is specified at the surface. The Stefan velocity implies that the mass flux of the species which is not controlled, nitrogen, is zero across the liquid surface. Since the vapor composition changes due to evaporation, the vapor phase is also subjected to natural convection. When the density changes due to evaporation, the vapor phase in the glass will start moving due to buoyancy.

The heat of evaporation at the liquid surface is

$$Q_{\rm b} = N_{\rm e} \Delta H_{\rm vap,e} + N_{\rm w} \Delta H_{\rm vap,w}$$
 (5)

Here N is the normal mass flux across the liquid surface,  $\Delta H_{\rm vap}$  is the species heat of vaporization (J/kg). The  $Q_{\rm b}$  is contributed from both the ethanol (index 'e') and water (index 'w'). The heat of evaporation can be picked up by a Boundary Heat Source feature under the Heat Transfer in Fluids interface.

The evaporation causes a heat loss at the liquid surface. The density in the vapor increases due to the lower temperature, which in turn induces or counteracts free convection.

# Results and Discussion

For each of the four alcohol cases, the model is solved for 900 s of evaporation. In Figure 2, a composite plot showing the resulting velocity, temperature, and mass fractions of the evaporated species at the final time step for the case of abv = 0.01, is seen. It is

evident from the velocity field that the vapor produced at the liquid surface is lighter than the surrounding air. The reason for this is that mostly water vapor is evaporated. As a consequence the vapor rises straight up from the glass. It can also be noted from the temperature field that the evaporation causes a temperature reduction close the liquid surface. Due to conduction in the glass, this also cools the ambient air on the outside of the glass, produces a downward motion in the air around the glass.

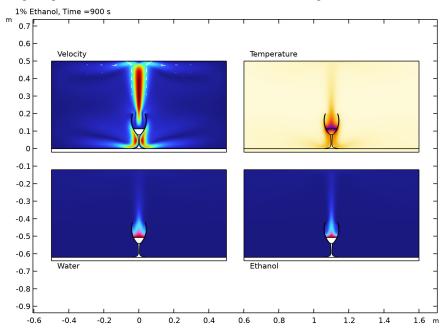

Figure 2: Velocity, temperature, and vapor phase mass fractions at t = 900 s for abv = 0.01.

The same type of figure for abv = 0.15, corresponding to an alcohol content similar to that of wine, is seen in Figure 3. In this case, a significantly higher ethanol concentration in the vapor is produced. Ethanol vapor has a higher density than air and the vapor inside the glass becomes heavier than the surrounding air and does not rise. Instead, the glass fills up with ethanol and water vapor from the liquid surface and up. Once the ethanol vapor reaches the brim of the glass it passes over and travels down on the outside of the glass.

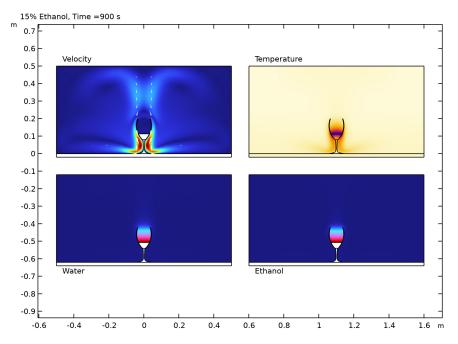

Figure 3: Velocity, temperature, and vapor phase mass fractions at t = 900 s for abv = 0.15.

Figure 4 shows the vapor velocity in the last time step for all four compositions computed. The development noted above continues also for the two higher alcohol content cases.

Higher concentrations of ethanol in the vapor phase leads to higher velocities in the vapor as it passes over the brim and down along the glass.

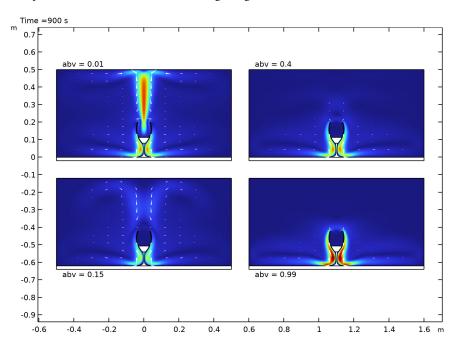

Figure 4: Vapor phase velocity at t = 900 s for all compositions.

Figure 5 shows the vapor mass flux, and accumulated mass, of water in the vapor phase for each abv. The vapor mass flux changes rapidly in the start but reaches an approximately linear development after around 200 s. The highest mass flux is seen for aby = 0.01. This case was noted above to be characterized by a rising convective stream due to buoyancy, which aids the transports vapor out of the glass. The mass flux for abv = 0.15 and abv = 0.4 are similar. But for the highest alcohol content, abv = 0.99, the vapor mass flux of water is negative throughout the entire time span. This implies that the water content in the air, due the relative humidity, is higher than the equilibrium vapor concentration at the liquid surface, leading to condensation of water into the liquid.

The vapor mass flux and accumulated mass ethanol is shown in Figure 6. The mass flux to the vapor phase is seen to strictly increase with the alcohol content in the liquid. This is in line with the fact that no ethanol is present in the air prior to the evaporation. It can also be noted that the accumulated mass of ethanol transported to the vapor is higher than that of water for all but the lowest alcohol content case.

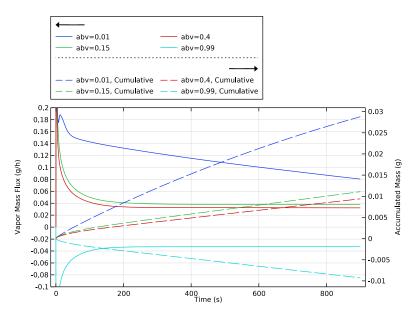

Figure 5: Vapor mass flux (solid lines) and accumulated mass (dashed lines) of water.

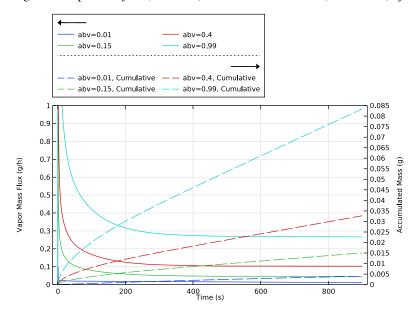

Figure 6: Vapor mass flux (solid lines) and accumulated mass (dashed lines) of ethanol.

The temperature at the center of the liquid surface is presented in Figure 7. For all ethanol contents, the temperature is reduced by the evaporation. The temperature reduction increases with alcohol content, except for the lowest alcohol case, for which the temperature eventually drops below the two intermediate cases (abv = 0.15, 0.4). This is attributed to the different flow field, as seen in Figure 2, where the cooled vapor travels along the surface to the center of the glass before is rises.

The heat of vaporization of ethanol and water is compared in Figure 8. It can be seen that water has a significantly higher heat of vaporization than ethanol. On a molar basis, the heat of vaporization is similar for the two species, with water having a 4% higher value at 25°C. On a mass basis, as in Figure 8, it is evident that water, despite being a small molecule, has an unusually high heat of vaporization. This can be attributed to the hydrogen bonds of water.

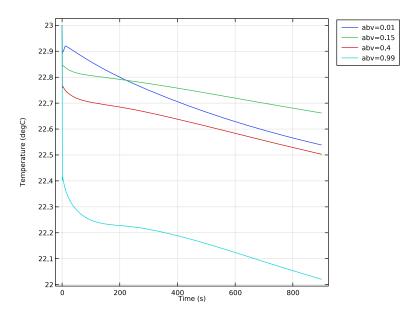

Figure 7: Temperature at the surface center for each abv.

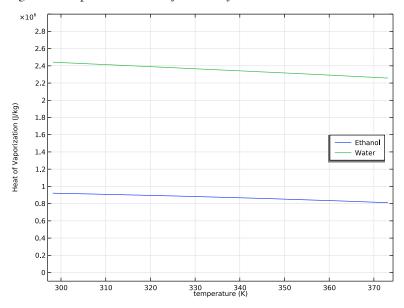

Figure 8: The heat of vaporization for ethanol and water varying with temperature.

Application Library path: Chemical Reaction Engineering Module/ Thermodynamics/ethanol water evaporation

# Modeling Instructions

From the File menu, choose New.

In the New window, click Model Wizard.

### MODEL WIZARD

- I In the Model Wizard window, click 2D Axisymmetric.
- 2 In the Select Physics tree, select Chemical Species Transport>Vapor Flow>Laminar Flow, **Concentrated Species.**
- 3 Click Add.
- 4 In the Number of species text field, type 3.
- 5 In the Mass fractions (1) table, enter the following settings:

wEth wW wN2

- 6 In the Select Physics tree, select Heat Transfer>Heat Transfer in Fluids (ht).
- 7 Click Add.
- 8 Click Study.
- 9 In the Select Study tree, select General Studies>Time Dependent.
- 10 Click Done.

Import model parameters from a file.

### **GLOBAL DEFINITIONS**

### Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.
- 3 Click **Load from File**.
- **4** Browse to the model's Application Libraries folder and double-click the file ethanol water evaporation parameters.txt.

In this model, a Vapor-Liquid System that contains compounds of water, ethanol, and nitrogen will be added from Thermodynamics. Thermodynamics functions from both vapor and liquid phases are created automatically based on requirements of mass transport and the saturated vapor from the vapor-liquid equilibrium on the boundary.

In the Physics toolbar, click Thermodynamics and choose Thermodynamic System.

### SELECT SYSTEM

- I Go to the Select System window.
- 2 From the Phase list, choose Vapor-liquid.
- 3 Click **Next** in the window toolbar.

# **SELECT SPECIES**

- I Go to the Select Species window.
- 2 In the Species list, select ethanol (64-17-5, C2H6O).
- 3 Click + Add Selected.
- 4 In the Species list, select nitrogen (7727-37-9, N2).
- 5 Click + Add Selected.
- 6 In the Species list, select water (7732-18-5, H20).
- 7 Click + Add Selected.
- 8 Click Next in the window toolbar.

Select the UNIQUAC for the Liquid phase model, keep the default model Soave-Redlich Kwong for the Gas phase model.

### SELECT THERMODYNAMIC MODEL

- I Go to the Select Thermodynamic Model window.
- 2 From the list, choose UNIQUAC.
- 3 Click Finish in the window toolbar.

### **GLOBAL DEFINITIONS**

Vapor-Liquid System I (ppl)

A Chemistry node can be generated from Vapor-Liquid System 1.

I In the Model Builder window, under Global Definitions>Thermodynamics right-click

Vapor-Liquid System I (ppI) and choose Generate Chemistry.

### SELECT SPECIES

- I Go to the Select Species window.
- 2 Click Add All.
- 3 Click **Next** in the window toolbar.

### CHEMISTRY SETTINGS

- I Go to the Chemistry Settings window.
- 2 From the Mass transfer list, choose Concentrated species.
- **3** Click **Finish** in the window toolbar.

# CHEMISTRY (CHEM)

- I In the Model Builder window, under Component I (compl) click Chemistry (chem).
- 2 In the Settings window for Chemistry, locate the Species Matching section.
- 3 From the Species solved for list, choose Transport of Concentrated Species in Vapor.
- **4** Find the **Bulk species** subsection. In the table, enter the following settings:

Species	Туре	Mass fraction	Value (I)	From Thermodynamics
C2H6O	Free species	wEth	Solved for	C2H6O
H2O	Free species	wW	Solved for	H2O
N2	Free species	wN2	Solved for	N2

### GEOMETRY I

Now, define the **Geometry** by inserting it from a file.

- I In the Geometry toolbar, click Insert Sequence.
- **2** Browse to the model's Application Libraries folder and double-click the file ethanol\_water\_evaporation\_geom\_sequence.mph.

3 In the Geometry toolbar, click Build All.

### MULTIPHYSICS

The Chemistry interface can be coupled to Heat Transfer in Fluids by the Reacting Flow Multiphysics Coupling.

Reacting Flow I (nirf1)

- I In the Model Builder window, expand the Component I (compl)>Multiphysics node, then click Reacting Flow I (nirfl).
- 2 In the Settings window for Reacting Flow, locate the Coupled Interfaces section.
- 3 From the Chemistry (optional) list, choose Chemistry (chem).
- 4 From the Heat transfer (optional, requires Chemistry) list, choose Heat Transfer in Fluids (ht).

Add an average function on the boundary where a Vapor-Liquid Interface feature will be added later.

### DEFINITIONS

Average I (aveop1)

- I In the **Definitions** toolbar, click Monlocal Couplings and choose Average.
- 2 In the Settings window for Average, locate the Source Selection section.
- 3 From the Geometric entity level list, choose Boundary.
- 4 Select Boundary 8 only.

Import variable definitions from a file.

Vapor-liquid interface variables

- I In the Model Builder window, right-click Definitions and choose Variables.
- 2 In the Settings window for Variables, type Vapor-liquid interface variables in the Label text field.
- 3 Locate the Variables section. Click the Load button. From the menu, choose Load from File.
- **4** Browse to the model's Application Libraries folder and double-click the file ethanol water evaporation interface variables.txt.
  - At this stage, the variable expressions are colored yellow. The variable definitions will appear normal when the **Vapor-Liquid Interface** feature is set later. The average functionaveop1 turns the local variable (at the boundary) to a global expression. Then, the expression is defined as a variable on the entire model.

### **GLOBAL DEFINITIONS**

Vapor-Liquid System I (pp I)

Now it is time to generate the materials. First, generate the materials that the beverage consists of. These could be generated from Vapor-Liquid System I under Thermodynamics.

I In the Model Builder window, under Global Definitions>Thermodynamics right-click Vapor-Liquid System I (ppI) and choose Generate Material.

### SELECT PHASE

- I Go to the Select Phase window.
- 2 From the list, choose Liquid.
- 3 Click **Next** in the window toolbar.

The beverage contains two species only: water and ethanol.

### SELECT SPECIES

- I Go to the Select Species window.
- 2 Click Remove All.
- 3 In the list, choose ethanol and water.
- 4 Click + Add Selected.
- 5 Find the Material composition subsection. Click the Mass fraction button.
- 6 Click **Next** in the window toolbar.

### SELECT PROPERTIES

- I Go to the Select Properties window.
- 2 Click Next in the window toolbar.

### DEFINE MATERIAL

- I Go to the Define Material window.
- 2 Click Finish in the window toolbar.

### MATERIALS

Liquid: ethanol-water | (pp | mat | )

- I In the Model Builder window, expand the Component I (compl)>Materials node, then click Liquid: ethanol-water I (pplmatl).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.

- 3 From the Selection list, choose Beverage.
- 4 Locate the Material Contents section. Find the Local properties subsection. In the table, enter the following settings:

Name	Expression	Unit	Description	Property group
xwl	wEthLiq		Mass fraction, ethanol	Basic
xw2	wWLiq		Mass fraction, water	Basic

The glass is made of silica glass, while the table is made of wood. These materials are found in the Material Library.

### ADD MATERIAL

- I In the Home toolbar, click Radd Material to open the Add Material window.
- 2 Go to the Add Material window.
- 3 In the Search text field, type silica glass.
- 4 Click Search.
- 5 In the tree, select Built-in>Silica glass.
- **6** Click **Add to Component** in the window toolbar.
- 7 In the Search text field, type wood (pine).
- 8 Click Search.
- 9 In the tree, select Building>Wood (pine).
- 10 Click Add to Component in the window toolbar.
- II In the Home toolbar, click **‡** Add Material to close the Add Material window.

### MATERIALS

Silica glass (mat I)

- I In the Model Builder window, under Component I (compl)>Materials click Silica glass (mat I).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- 3 From the Selection list, choose Glass.

Wood (bine) (mat2)

- I In the Model Builder window, click Wood (pine) (mat2).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- 3 From the Selection list, choose Table.

### TRANSPORT OF CONCENTRATED SPECIES IN VAPOR (TCS)

- I In the Model Builder window, under Component I (compl) click Transport of Concentrated Species in Vapor (tcs).
- 2 In the Settings window for Transport of Concentrated Species in Vapor, locate the Domain Selection section.
- 3 From the Selection list, choose Vapor/Air.
- 4 Locate the Species section. From the From mass constraint list, choose wN2.

# Transport Properties 1

- I In the Model Builder window, expand the Transport of Concentrated Species in Vapor (tcs) node, then click Transport Properties 1.
- 2 In the Settings window for Transport Properties, locate the Density section.
- **3** From the  $\rho$  list, choose **Density (chem)**.
- **4** Locate the **Diffusion** section. In the table, enter the following settings:

Species I	Species 2	Diffusivity	Diffusion coefficient (m^2/s)
wEth	wW	Maxwell-Stefan diffusivity , C2H6O-H2O (chem)	comp I .chem.D_C2H6O_ H2O
wEth	wN2	Maxwell-Stefan diffusivity , C2H6O-N2 (chem)	comp I .chem.D_C2H6O_ N2
wW	wN2	Maxwell-Stefan diffusivity , H2O-N2 (chem)	comp I.chem.D_H2O_N2

### Initial Values 1

- I In the Model Builder window, click Initial Values I.
- 2 In the Settings window for Initial Values, locate the Initial Values section.
- **3** In the  $\omega_{0,wEth}$  text field, type wEth0.
- **4** In the  $\omega_{0,wW}$  text field, type wwo.

Remove the default feature **Vapor Inflow** because there is no vapor inflow in this model.

### Vapor Inflow I

In the Model Builder window, right-click Vapor Inflow I and choose Delete.

### Vapor-Liquid Interface 1

- I In the Model Builder window, under Component I (compl)>
  Transport of Concentrated Species in Vapor (tcs) click Vapor-Liquid Interface I.
- 2 Select Boundary 8 only.

- 3 In the Settings window for Vapor-Liquid Interface, locate the Vapor Equilibrium section.
- 4 From the Liquid list, choose Thermochemistry coupling.
- **5** From the Chemistry list, choose Chemistry (chem).
- 6 Find the Evaporating/condensing species subsection. Select the wEth, C2H60 (ethanol) check box.
- 7 Select the wW, H20 (water) check box.
- 8 Locate the Liquid Phase section. From the Liquid phase concentration type list, choose Volume fraction
- **9** In the table, enter the following settings:

Species	Volume fraction (I)
C2H6O (ethanol)	abv
N2 (nitrogen)	0
H2O (water)	1-abv

- **10** Click the **Show More Options** button in the **Model Builder** toolbar.
- II In the Show More Options dialog box, in the tree, select the check box for the node Physics>Advanced Physics Options.
- I2 Click OK.
- 13 In the Settings window for Vapor-Liquid Interface, click to expand the Constraint Settings section.
- 14 From the Constraint list, choose Weak constraints.

### LAMINAR FLOW (SPF)

- I In the Model Builder window, under Component I (compl) click Laminar Flow (spf).
- 2 In the Settings window for Laminar Flow, locate the Domain Selection section.
- 3 From the Selection list, choose Vapor/Air.
- 4 Locate the Physical Model section. From the Compressibility list, choose Compressible flow (Ma<0.3).

The compressible flow for Ma less than 0.3 indicates that the inlet and outlet conditions may not be suitable for transonic or supersonic flow.

- **5** Select the **Include gravity** check box.
- **6** In the  $p_{ref}$  text field, type p0.

A Vapor-Liquid Slip at the surface interface should be accounted for.

Vapor-Liquid Slip

- I In the Physics toolbar, click Boundaries and choose Wall.
- 2 In the Settings window for Wall, type Vapor-Liquid Slip in the Label text field.
- **3** Select Boundary 8 only.
- 4 Locate the Boundary Condition section. From the Wall condition list, choose Navier slip.

# HEAT TRANSFER IN FLUIDS (HT)

Initial Values 1

- I In the Model Builder window, expand the Component I (compl)> Heat Transfer in Fluids (ht) node, then click Initial Values I.
- 2 In the Settings window for Initial Values, locate the Initial Values section.
- **3** In the *T* text field, type T0.

Solid 1

- I In the Physics toolbar, click **Domains** and choose **Solid**. Choosing a **Solid** domain creates a difference in heat transfer between beverage, glass, table, and air.
- **2** Select Domains 1–3 only.

To demonstrate the evaporation heat from the surface of the beverage, a **Boundary Heat Source** is used.

Boundary Heat Source I

- I In the Physics toolbar, click Boundaries and choose Boundary Heat Source.
- 2 In the Settings window for Boundary Heat Source, locate the Boundary Selection section.
- 3 From the Selection list, choose Vapor-Liquid Surface.
- **4** Locate the **Boundary Heat Source** section. From the  $Q_b$  list, choose Evaporative heat flux (tcs/vII).

Temperature I

- I In the Physics toolbar, click Boundaries and choose Temperature.
- 2 Select Boundary 2 only.
- 3 In the Settings window for Temperature, locate the Temperature section.
- **4** In the  $T_0$  text field, type T0.

Now, create the Mesh.

### MESH I

- I In the Model Builder window, under Component I (compl) click Mesh I.
- 2 In the Settings window for Mesh, locate the Sequence Type section.
- **3** From the list, choose **User-controlled mesh**.

### Size 3

- I Right-click Component I (compl)>Mesh I and choose Size.
- 2 Drag and drop Size 3 below Size 2.
- 3 In the Settings window for Size, locate the Geometric Entity Selection section.
- 4 From the Geometric entity level list, choose Boundary.
- **5** Select Boundary 32 only.
- 6 Locate the Element Size section. From the Calibrate for list, choose Fluid dynamics.
- **7** From the **Predefined** list, choose **Finer**.
- 8 Click the **Custom** button.
- 9 Locate the Element Size Parameters section.
- 10 Select the Maximum element size check box. In the associated text field, type 0.01.

### Size 4

- I In the Model Builder window, right-click Mesh I and choose Size.
- 2 Drag and drop Size 4 below Size 3.
- 3 In the Settings window for Size, locate the Geometric Entity Selection section.
- 4 From the Geometric entity level list, choose Boundary.
- **5** Select Boundaries 35 and 36 only.
- 6 Locate the Element Size section. From the Calibrate for list, choose Fluid dynamics.
- 7 From the **Predefined** list, choose **Finer**.
- 8 Click the **Custom** button.
- 9 Locate the Element Size Parameters section.
- 10 Select the Maximum element size check box. In the associated text field, type 0.75 [cm].

### Size 1

- I In the Model Builder window, right-click Free Triangular I and choose Size.
- 2 In the Settings window for Size, locate the Geometric Entity Selection section.
- 3 From the Geometric entity level list, choose Domain.
- **4** Select Domain 5 only.

- 5 Locate the Element Size section. From the Calibrate for list, choose Fluid dynamics.
- 6 From the Predefined list, choose Coarse.
- 7 Click the **Custom** button.
- 8 Locate the Element Size Parameters section.
- 9 Select the Maximum element growth rate check box. In the associated text field, type 1.15.

## Boundary Layers 1

- I In the Model Builder window, under Component I (compl)>Mesh I click Boundary Layers I.
- **2** Select Domains 3–5 only.

# Boundary Layer Properties 1

- I In the Model Builder window, expand the Boundary Layers I node, then click Boundary Layer Properties I.
- **2** Select Boundaries 7–22, 24–27, and 29–34 only.
- 3 In the Settings window for Boundary Layer Properties, locate the Layers section.
- 4 In the Number of layers text field, type 4.
- 5 In the Thickness adjustment factor text field, type 2.
- 6 Click | Build Selected.

### Size 1

In the Model Builder window, under Component I (compl)>Mesh I right-click Size I and choose Delete.

### Size 2

- I In the Model Builder window, under Component I (compl)>Mesh I click Size 2.
- **2** Select Boundaries 7, 9–23, 25, 26, 28, 31, 32, and 34 only.
- 3 In the Settings window for Size, locate the Element Size section.
- 4 From the Calibrate for list, choose Fluid dynamics.
- 5 From the Predefined list, choose Extra fine.

# Size 5

- I In the Model Builder window, right-click Mesh I and choose Size.
- 2 Drag and drop Size 5 below Size 4.
- 3 In the Settings window for Size, locate the Geometric Entity Selection section.
- 4 From the Geometric entity level list, choose Boundary.

- **5** Select Boundary 7 only.
- 6 Locate the Element Size section. From the Calibrate for list, choose Fluid dynamics.
- 7 From the Predefined list, choose Extra fine.

# Free Triangular 2

- I In the Mesh toolbar, click Free Triangular.
- 2 Drag and drop below Size.
- 3 In the Settings window for Free Triangular, locate the Domain Selection section.
- 4 From the Geometric entity level list, choose Domain.
- **5** Select Domain 4 only.

### Size 1

- I Right-click Free Triangular 2 and choose Size.
- 2 In the Settings window for Size, locate the Element Size section.
- 3 From the Calibrate for list, choose Fluid dynamics.
- 4 From the Predefined list, choose Extra fine.
- **5** Click the **Custom** button.
- 6 Locate the Element Size Parameters section.
- 7 Select the Maximum element size check box. In the associated text field, type 0.0015.

### Size 2

- I In the Model Builder window, right-click Free Triangular 2 and choose Size.
- 2 In the Settings window for Size, locate the Geometric Entity Selection section.
- **3** From the **Geometric entity level** list, choose **Point**.
- **4** Select Point 19 only.
- 5 Locate the Element Size section. From the Calibrate for list, choose Fluid dynamics.
- 6 From the Predefined list, choose Extra fine.
- 7 Click the **Custom** button.
- 8 Locate the Element Size Parameters section.
- 9 Select the Maximum element size check box. In the associated text field, type 3e-4.
- 10 Click Build Selected.

### Size 3

- I Right-click Free Triangular 2 and choose Size.
- 2 In the Settings window for Size, locate the Geometric Entity Selection section.

- 3 From the Geometric entity level list, choose Boundary.
- 4 Select Boundaries 25 and 26 only.
- **5** Locate the **Element Size** section. Click the **Custom** button.
- 6 Locate the Element Size Parameters section.
- 7 Select the Curvature factor check box. In the associated text field, type 0.1.
- 8 Click **Build Selected**.
- 9 Click Build All.

By using a **Parametric Sweep**, the results can be observed for several abv values.

### STUDY I

# Parametric Sweep

- I In the Study toolbar, click Parametric Sweep.
- 2 In the Model Builder window, expand the Study I node, then click Parametric Sweep.
- 3 In the Settings window for Parametric Sweep, locate the Study Settings section.
- 4 Click + Add.
- **5** In the table, enter the following settings:

Parameter name	Parameter value list	Parameter unit
abv (0.35 Alcohol by volume)	0.01 0.15 0.4 0.99	

Solution I (soll)

# Step 1: Time Dependent

- I In the Model Builder window, expand the Study I node, then click Step 1: Time Dependent.
- 2 In the Settings window for Time Dependent, locate the Study Settings section.
- 3 In the Output times text field, type range (0,0.1,1) range (1.25,0.25,4) range (5, 1,20) range(25,5,120) range(130,10,240) range(270,30,900).

# Solution I (soll)

- I In the Model Builder window, expand the Study I>Solver Configurations> Solution I (soll)>Dependent Variables I node, then click Temperature (compl.T).
- 2 In the Settings window for Field, locate the Scaling section.
- 3 From the Method list, choose Manual.

- 4 In the Scale text field, type T0.
- 5 In the Model Builder window, under Study I>Solver Configurations>Solution I (soll)> Dependent Variables I click Velocity field (compl.u).
- 6 In the Settings window for Field, locate the Scaling section.
- 7 From the Method list, choose Manual.
- 8 In the Scale text field, type 0.01.
- 9 In the Model Builder window, under Study I>Solver Configurations>Solution I (sol1)> Dependent Variables I click Mass fraction (compl.wEth).
- 10 In the Settings window for Field, locate the Scaling section.
- II From the Method list, choose Manual.
- 12 In the Model Builder window, under Study I>Solver Configurations>Solution I (soll)> Dependent Variables I click Mass fraction (compl.wW).
- 13 In the Settings window for Field, locate the Scaling section.
- 14 From the Method list, choose Manual.

Use an initial time step of 1 ms. This is small compared to the time scale and will make it easy for the transient solver to start.

- I In the Model Builder window, under Study I>Solver Configurations>Solution I (soll) click Time-Dependent Solver 1.
- 2 In the Settings window for Time-Dependent Solver, click to expand the Time Stepping section.
- 3 Select the **Initial step** check box.
- **4** In the **Study** toolbar, click  $t_{=0}^{U}$  **Get Initial Value** to generate the default datasets and plots. This means that a plot to be shown while solving can be chosen as well. For that purpose, create a **Plot Group** showing both velocity, temperature, and mass fractions.

### RESULTS

2D Plot Group 11

In the Home toolbar, click Add Plot Group and choose 2D Plot Group.

Mirror 2D I

- I In the Results toolbar, click More Datasets and choose Mirror 2D.
- 2 In the Settings window for Mirror 2D, click to expand the Advanced section.
- 3 Select the Remove elements on the symmetry axis check box.

Array: Velocity, Temperature, and Mass Fractions

- I In the Model Builder window, under Results click 2D Plot Group II.
- 2 In the Settings window for 2D Plot Group, type Array: Velocity, Temperature, and Mass Fractions in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Mirror 2D 1.
- 4 Click to expand the **Title** section. Locate the **Color Legend** section. Select the Show maximum and minimum values check box.
- **5** Select the **Show units** check box.
- 6 Click to expand the Number Format section. Select the Manual color legend settings check box.
- 7 From the Notation list, choose Scientific.
- 8 Click to expand the Plot Array section. Select the Enable check box.
- 9 From the Array shape list, choose Square.
- 10 From the Order list, choose Column-major.
- II In the Relative row padding text field, type 0.1.
- 12 In the Relative column padding text field, type 0.1.

# Velocity

- I Right-click Array: Velocity, Temperature, and Mass Fractions and choose Surface.
- 2 In the Settings window for Surface, type Velocity in the Label text field.
- 3 Click to expand the Expression section. In the Expression text field, type spf. U.

### Mass Fraction, Water

- I Right-click Array: Velocity, Temperature, and Mass Fractions and choose Surface.
- 2 In the Settings window for Surface, type Mass Fraction, Water in the Label text field.
- **3** Locate the **Expression** section. In the **Expression** text field, type www.
- 4 Locate the Coloring and Style section. Click Change Color Table.
- 5 In the Color Table dialog box, select Wave>Disco in the tree.
- 6 Click OK.
- 7 In the Settings window for Surface, click to expand the Plot Array section.
- 8 Select the Manual indexing check box.
- 9 In the Row index text field, type -1.

### Temperature

I Right-click Array: Velocity, Temperature, and Mass Fractions and choose Surface.

- 2 In the Settings window for Surface, type Temperature in the Label text field.
- **3** Locate the **Expression** section. In the **Expression** text field, type T.
- 4 From the **Unit** list, choose **degC**.
- 5 Locate the Coloring and Style section. Click Change Color Table.
- 6 In the Color Table dialog box, select Thermal>HeatCamera in the tree.
- 7 Click OK.
- 8 In the Settings window for Surface, locate the Plot Array section.
- 9 Select the Manual indexing check box.
- 10 In the Column index text field, type 1.

Mass Fraction, Water

In the Model Builder window, right-click Mass Fraction, Water and choose Duplicate.

# Mass Fraction, Ethanol

- I In the Model Builder window, under Results>Array: Velocity, Temperature, and Mass Fractions click Mass Fraction, Water I.
- 2 In the Settings window for Surface, type Mass Fraction, Ethanol in the Label text field.
- **3** Locate the **Expression** section. In the **Expression** text field, type wEth.
- 4 Locate the Plot Array section. Select the Manual indexing check box.
- 5 In the Column index text field, type 1.
- 6 In the Array: Velocity, Temperature, and Mass Fractions toolbar, click Plot.

Array: Velocity, Temperature, and Mass Fractions

- I In the Model Builder window, click Array: Velocity, Temperature, and Mass Fractions.
- 2 In the Settings window for 2D Plot Group, locate the Color Legend section.
- 3 From the Position list, choose Right double.

Arrow Surface 1

- I In the Model Builder window, right-click Array: Velocity, Temperature, and Mass Fractions and choose Arrow Surface.
- 2 In the Settings window for Arrow Surface, locate the Arrow Positioning section.
- 3 Find the x grid points subsection. In the Points text field, type 12.
- 4 Find the y grid points subsection. In the Points text field, type 12.
- 5 Locate the Coloring and Style section. From the Arrow type list, choose Cone.
- 6 From the Arrow length list, choose Logarithmic.

- 7 In the Range quotient text field, type 20.
- 8 From the Color list, choose White.
- **9** Click to expand the **Plot Array** section. Select the **Manual indexing** check box.

## Annotation: Velocity

- I In the Model Builder window, right-click Array: Velocity, Temperature, and Mass Fractions and choose Annotation.
- 2 In the Settings window for Annotation, type Annotation: Velocity in the Label text field.
- **3** Locate the **Annotation** section. In the **Text** text field, type **Velocity**.
- 4 Locate the **Position** section. In the **x** text field, type -0.5.
- **5** In the **y** text field, type **0.5**.
- 6 Locate the Coloring and Style section. Clear the Show point check box.
- 7 Click to expand the Plot Array section. Clear the Belongs to array check box.
- 8 Locate the Coloring and Style section. From the Anchor point list, choose Lower left.
- **9** Right-click **Annotation: Velocity** and choose **Duplicate**.

### Annotation: Temperature

- I In the Model Builder window, under Results>Array: Velocity, Temperature, and Mass Fractions click Annotation: Velocity I.
- 2 In the Settings window for Annotation, type Annotation: Temperature in the Label text field.
- **3** Locate the **Annotation** section. In the **Text** text field, type **Temperature**.
- 4 Locate the **Position** section. In the x text field, type 0.6.
- **5** Right-click **Annotation: Temperature** and choose **Duplicate**.

# Annotation: Water

- I In the Model Builder window, under Results>Array: Velocity, Temperature, and Mass Fractions click Annotation: Temperature 1.
- 2 In the Settings window for Annotation, type Annotation: Water in the Label text field.
- 3 Locate the Annotation section. In the **Text** text field, type Water.
- 4 Locate the **Position** section. In the **x** text field, type -0.5.
- 5 In the y text field, type -0.7.
- 6 Right-click Annotation: Water and choose Duplicate.

Annotation: Ethanol

- I In the Model Builder window, under Results>Array: Velocity, Temperature, and Mass Fractions click Annotation: Water I.
- 2 In the Settings window for Annotation, type Annotation: Ethanol in the Label text field.
- 3 Locate the Annotation section. In the Text text field, type Ethanol.
- 4 Locate the **Position** section. In the x text field, type 0.6.
- 5 Click the **Zoom Extents** button in the **Graphics** toolbar.

### STUDY I

Step 1: Time Dependent

- I In the Model Builder window, under Study I click Step I: Time Dependent.
- 2 In the Settings window for Time Dependent, click to expand the Results While Solving section.
- **3** Select the **Plot** check box.
- 4 From the Plot group list, choose Array: Velocity, Temperature, and Mass Fractions.
- 5 From the Update at list, choose Time steps taken by solver.

Parametric Sweep

- I In the Model Builder window, click Parametric Sweep.
- 2 In the Settings window for Parametric Sweep, locate the Output While Solving section.
- **3** Select the **Plot** check box.
- 4 From the Plot group list, choose Array: Velocity, Temperature, and Mass Fractions.

Now compute the solutions for the four different alcohol contents.

In the **Home** toolbar, click **Compute**.

Point the mirror dataset to the parametric solutions to be able to plot results from all compositions.

### RESULTS

Mirror 2D I

- I In the Model Builder window, under Results>Datasets click Mirror 2D 1.
- 2 In the Settings window for Mirror 2D, locate the Data section.
- 3 From the Dataset list, choose Study I/Parametric Solutions I (sol2).

Now create a plot that shows the velocity in the vapor phase for all four compositions at the same time step.

Array: Velocity all cases

- I In the Home toolbar, click **Add Plot Group** and choose **2D Plot Group**.
- 2 In the Settings window for 2D Plot Group, type Array: Velocity all cases in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Mirror 2D 1.
- 4 Click to expand the **Title** section. From the **Title type** list, choose **Manual**.
- 5 In the Parameter indicator text field, type Time =eval(t) s.
- 6 Click to expand the Plot Array section. Select the Enable check box.
- 7 From the Array shape list, choose Square.
- 8 In the Relative row padding text field, type 0.1.
- 9 In the Relative column padding text field, type 0.1.

abv = 0.01

- I Right-click Array: Velocity all cases and choose Surface.
- 2 In the Settings window for Surface, type abv = 0.01 in the Label text field.
- 3 Locate the Expression section. In the Expression text field, type withsol('sol2', spf.U, setval(abv, 0.01, t, t)).
- 4 Click to expand the Plot Array section. In the Array: Velocity all cases toolbar, click Plot.
- 5 Right-click abv = 0.01 and choose Duplicate.

abv = 0.15

- I In the Model Builder window, under Results>Array: Velocity all cases click aby = 0.01.1.
- 2 In the Settings window for Surface, type abv = 0.15 in the Label text field.
- **3** Locate the **Expression** section. In the **Expression** text field, type withsol('sol2', spf.U, setval(abv, 0.15, t, t)).
- 4 Locate the Plot Array section. Select the Manual indexing check box.
- 5 In the Row index text field, type -1.
- 6 Click to expand the Inherit Style section. From the Plot list, choose abv = 0.01.
- 7 In the Array: Velocity all cases toolbar, click **7** Plot.
- **8** Right-click **abv = 0.15** and choose **Duplicate**.

abv = 0.4

- I In the Model Builder window, under Results>Array: Velocity all cases click aby = 0.15.1.
- 2 In the Settings window for Surface, type abv = 0.4 in the Label text field.
- 3 Locate the Expression section. In the Expression text field, type withsol('sol2', spf.U, setval(abv, 0.4, t, t)).
- **4** Locate the **Plot Array** section. In the **Row index** text field, type 0.
- 5 In the Column index text field, type 1.
- 7 Right-click abv = 0.4 and choose Duplicate.

abv = 0.99

- I In the Model Builder window, under Results>Array: Velocity all cases click abv = 0.4.1.
- 2 In the Settings window for Surface, type abv = 0.99 in the Label text field.
- 3 Locate the Expression section. In the Expression text field, type withsol('sol2', spf.U, setval(abv, 0.99, t, t)).
- 4 Locate the Plot Array section. In the Row index text field, type -1.
- 5 In the Array: Velocity all cases toolbar, click Plot.

Arrow Surface: abv = 0.01

- I In the Model Builder window, right-click Array: Velocity all cases and choose Arrow Surface.
- 2 In the Settings window for Arrow Surface, type Arrow Surface: abv = 0.01 in the Label text field.
- 3 Locate the Expression section. In the x-component text field, type withsol('sol2', u, setval(abv, 0.01, t, t)).
- 4 In the y-component text field, type withsol('sol2',w,setval(abv,0.01,t,t)).
- 5 Locate the Arrow Positioning section. Find the x grid points subsection. In the Points text field, type 12.
- 6 Find the y grid points subsection. In the Points text field, type 12.
- 7 Locate the Coloring and Style section. From the Arrow type list, choose Cone.
- 8 From the Arrow length list, choose Logarithmic.
- 9 In the Range quotient text field, type 20.
- **10** From the **Color** list, choose **White**.
- II Locate the Plot Array section. Select the Manual indexing check box.

12 Right-click Arrow Surface: abv = 0.01 and choose Duplicate.

Arrow Surface: abv = 0.15

- I In the Model Builder window, under Results>Array: Velocity all cases click Arrow Surface: aby = 0.01.1.
- 2 In the Settings window for Arrow Surface, type Arrow Surface: abv = 0.15 in the Label text field.
- **3** Locate the **Expression** section. In the **x-component** text field, type withsol('sol2',u, setval(abv,0.15,t,t)).
- 4 In the y-component text field, type withsol('sol2',w,setval(abv,0.15,t,t)).
- 5 Locate the Plot Array section. In the Row index text field, type -1.
- 6 Right-click Arrow Surface: abv = 0.15 and choose Duplicate.

Arrow Surface: abv = 0.4

- I In the Model Builder window, under Results>Array: Velocity all cases click
  Arrow Surface: abv = 0.15.1.
- 2 In the Settings window for Arrow Surface, type Arrow Surface: abv = 0.4 in the Label text field.
- 3 Locate the Expression section. In the x-component text field, type withsol('sol2',u, setval(abv,0.4,t,t)).
- 4 In the y-component text field, type withsol('sol2',w,setval(abv,0.4,t,t)).
- **5** Locate the **Plot Array** section. In the **Row index** text field, type 0.
- 6 In the Column index text field, type 1.
- 7 Right-click Arrow Surface: abv = 0.4 and choose Duplicate.

Arrow Surface: abv = 0.99

- I In the Model Builder window, under Results>Array: Velocity all cases click
  Arrow Surface: aby = 0.4.1.
- 2 In the Settings window for Arrow Surface, type Arrow Surface: abv = 0.99 in the Label text field.
- **3** Locate the **Expression** section. In the **x-component** text field, type withsol('sol2',u, setval(abv,0.99,t,t)).
- 4 In the y-component text field, type withsol('sol2',w,setval(abv,0.99,t,t)).
- 5 Locate the Plot Array section. In the Row index text field, type -1.
- 6 In the Array: Velocity all cases toolbar, click **Plot**.
- 7 Click the **Zoom Extents** button in the **Graphics** toolbar.

abv = 0.15

- I In the Model Builder window, click abv = 0.15.
- 2 In the Settings window for Surface, click to expand the Inherit Style section.
- 3 From the Plot list, choose abv = 0.01.
- 4 In the Array: Velocity all cases toolbar, click  **Plot**.
- 5 Click the **Zoom Extents** button in the **Graphics** toolbar.

Annotation: abv = 0.01

- I In the Model Builder window, right-click Array: Velocity all cases and choose Annotation.
- 2 In the Settings window for Annotation, type Annotation: abv = 0.01 in the Label text field.
- 3 Locate the Annotation section. In the Text text field, type abv = 0.01.
- 4 Locate the **Position** section. In the x text field, type -0.5.
- 5 In the y text field, type 0.5.
- 6 Locate the Coloring and Style section. Clear the Show point check box.
- 7 From the Anchor point list, choose Lower left.
- 8 Locate the Plot Array section. Clear the Belongs to array check box.
- 9 In the Array: Velocity all cases toolbar, click **9** Plot.
- **10** Right-click **Annotation: abv = 0.01** and choose **Duplicate**.

Annotation: abv = 0.4

- I In the Model Builder window, under Results>Array: Velocity all cases click Annotation: abv = 0.01.1.
- 2 In the Settings window for Annotation, type Annotation: abv = 0.4 in the Label text field.
- 3 Locate the Annotation section. In the Text text field, type abv = 0.4.
- 4 Locate the **Position** section. In the x text field, type 0.6.
- 5 In the Array: Velocity all cases toolbar, click Plot.
- **6** Right-click **Annotation: abv = 0.4** and choose **Duplicate**.

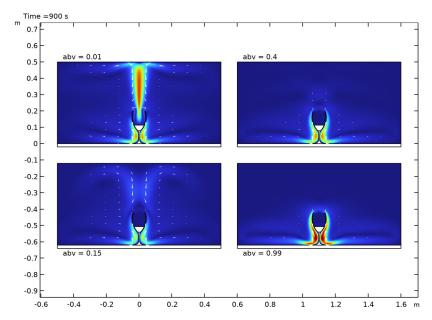

Annotation: abv = 0.15

- I In the Model Builder window, under Results>Array: Velocity all cases click Annotation: abv = 0.4.1.
- 2 In the Settings window for Annotation, type Annotation: abv = 0.15 in the Label text field.

- 3 Locate the Annotation section. In the Text text field, type abv = 0.15.
- 4 Locate the **Position** section. In the x text field, type -0.5.
- **5** In the **y** text field, type -0.7.
- 6 In the Array: Velocity all cases toolbar, click  **Plot**.
- 7 Right-click Annotation: abv = 0.15 and choose Duplicate.

Annotation: abv = 0.99

- I In the Model Builder window, under Results>Array: Velocity all cases click Annotation: aby = 0.15.1.
- 2 In the Settings window for Annotation, type Annotation: abv = 0.99 in the Label text field.
- 3 Locate the Annotation section. In the Text text field, type abv = 0.99.
- 4 Locate the **Position** section. In the x text field, type 0.6.
- 5 In the Array: Velocity all cases toolbar, click Plot.

Now, create line graphs evaluating the mass flux due to evaporation. To obtain these, integrate the normal total fluxes of ethanol and water along the vapor-liquid surface.

**Evaluation: Water Flux** 

I In the Results toolbar, click Evaluation Group.

- 2 In the Settings window for Evaluation Group, type Evaluation: Water Flux in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 1/ Parametric Solutions I (sol2).

# Line Integration I

- I Right-click Evaluation: Water Flux and choose Integration>Line Integration.
- 2 In the Settings window for Line Integration, locate the Data section.
- 3 From the Table columns list, choose abv.
- 4 Locate the Selection section. From the Selection list, choose Vapor-Liquid Surface.
- **5** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
-tcs.ntflux_wW	g/h	

- 6 In the Evaluation: Water Flux toolbar, click **= Evaluate**.
- 7 Right-click Line Integration I and choose Duplicate.

### Line Integration 2

- I In the Model Builder window, click Line Integration 2.
- 2 In the Settings window for Line Integration, locate the Data Series Operation section.
- 3 From the Transformation list, choose Integral.
- 4 Select the Cumulative check box.
- 5 In the Evaluation: Water Flux toolbar, click **= Evaluate**.

# ID Plot Group 13

In the Home toolbar, click Add Plot Group and choose ID Plot Group.

# Table Graph 1

- I Right-click ID Plot Group 13 and choose Table Graph.
- 2 In the Settings window for Table Graph, locate the Data section.
- 3 From the Source list, choose Evaluation group.
- 4 From the Evaluation group list, choose Evaluation: Water Flux.
- 5 From the Plot columns list, choose Manual.
- 6 In the Columns list, choose aby=0.01, -tcs.ntflux wW (g/h), aby=0.15, -tcs.ntflux wW (g/h) h), abv=0.4, -tcs.ntflux\_wW (g/h), and abv=0.99, -tcs.ntflux\_wW (g/h).
- 7 In the ID Plot Group 13 toolbar, click Plot.

8 Right-click Table Graph I and choose Duplicate.

### Water Mass Flux

- I In the Model Builder window, under Results click ID Plot Group 13.
- 2 In the Settings window for ID Plot Group, type Water Mass Flux in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose None.
- 4 Locate the Plot Settings section.
- 5 Select the **y-axis label** check box. In the associated text field, type Vapor Mass Flux (g/h).
- 6 Select the Two y-axes check box.
- 7 Select the Secondary y-axis label check box. In the associated text field, type Accumulated Mass (g).
- 8 In the table, select the Plot on secondary y-axis check box for Table Graph 2.
- 9 Locate the Legend section. From the Layout list, choose Outside graph axis area.
- **10** From the **Position** list, choose **Top**.
- II In the Number of rows text field, type 2.

# Table Graph 2

- I In the Model Builder window, click Table Graph 2.
- 2 In the Settings window for Table Graph, locate the Data section.
- 3 In the Columns list, choose abv=0.01, Cumulative integral: -tcs.ntflux\_wW (g), abv=0.15, Cumulative integral: -tcs.ntflux\_wW (g), abv=0.4, Cumulative integral: -tcs.ntflux\_wW (g), and abv=0.99, Cumulative integral: -tcs.ntflux\_wW (g).
- 4 Locate the Coloring and Style section. Find the Line style subsection. From the Line list, choose Dashed.
- 5 From the Color list, choose Cycle (reset).
- 6 In the Water Mass Flux toolbar, click Plot.

### Water Mass Flux

- I In the Model Builder window, click Water Mass Flux.
- 2 In the Settings window for ID Plot Group, locate the Axis section.
- 3 Select the Manual axis limits check box.
- **4** In the **y minimum** text field, type -0.1.
- 5 In the y maximum text field, type 0.2.
- 6 In the Water Mass Flux toolbar, click Plot.

Evaluation: Water Flux

In the Model Builder window, right-click Evaluation: Water Flux and choose Duplicate.

**Evaluation:** Ethanol Flux

- I In the Model Builder window, expand the Results>Evaluation: Water Flux I node, then click Evaluation: Water Flux 1.
- 2 In the Settings window for Evaluation Group, type Evaluation: Ethanol Flux in the **Label** text field.

Line Integration I

- I In the Model Builder window, click Line Integration I.
- 2 In the Settings window for Line Integration, click Replace Expression in the upper-right corner of the Expressions section. From the menu, choose Component I (compl)> Transport of Concentrated Species in Vapor>Species wEth>Fluxes>tcs.ntflux\_wEth -Normal total flux - kg/(m2·s).
- **3** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
-tcs.ntflux_wEth	g/h	

# Line Integration 2

- I In the Model Builder window, click Line Integration 2.
- 2 In the Settings window for Line Integration, click Replace Expression in the upper-right corner of the Expressions section. From the menu, choose tcs.ntflux\_wEth -Normal total flux - kg/(m2·s).
- **3** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
-tcs.ntflux_wEth	g/h	

4 In the Evaluation: Ethanol Flux toolbar, click **= Evaluate**.

Water Mass Flux

In the Model Builder window, under Results right-click Water Mass Flux and choose Duplicate.

Ethanol Mass Flux

- I In the Model Builder window, under Results click Water Mass Flux I.
- 2 In the Settings window for ID Plot Group, type Ethanol Mass Flux in the Label text field.

# Table Graph 1

- I In the Model Builder window, expand the Ethanol Mass Flux node, then click Table Graph 1.
- 2 In the Settings window for Table Graph, locate the Data section.
- 3 From the Evaluation group list, choose Evaluation: Ethanol Flux.

# Table Graph 2

- I In the Model Builder window, click Table Graph 2.
- 2 In the Settings window for Table Graph, locate the Data section.
- 3 From the Evaluation group list, choose Evaluation: Ethanol Flux.
- 4 In the Ethanol Mass Flux toolbar, click Plot.

### Ethanol Mass Flux

- I In the Model Builder window, click Ethanol Mass Flux.
- 2 In the Settings window for ID Plot Group, locate the Axis section.
- 3 Select the Manual axis limits check box.
- **4** In the **y minimum** text field, type **0**.
- 5 In the y maximum text field, type 1.
- 6 In the Secondary y minimum text field, type 0.
- 7 In the Secondary y maximum text field, type 0.085.

# **Evaluation:** Kinetic Energy

- I In the Results toolbar, click Evaluation Group.
- 2 In the Settings window for Evaluation Group, type Evaluation: Kinetic Energy in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 1/ Parametric Solutions I (sol2).

# Surface Integration 1

- I Right-click Evaluation: Kinetic Energy and choose Integration>Surface Integration.
- 2 In the Settings window for Surface Integration, locate the Data section.
- 3 From the Table columns list, choose abv.
- 4 Locate the Selection section. From the Selection list, choose Vapor/Air.

**5** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
spf.rho*spf.U	N*s	

6 In the Evaluation: Kinetic Energy toolbar, click **= Evaluate**.

# Kinetic Energy

- I In the Home toolbar, click Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Kinetic Energy in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose None.
- 4 Locate the **Plot Settings** section.
- 5 Select the y-axis label check box. In the associated text field, type Kinetic Energy (N\*
- 6 Locate the Legend section. From the Layout list, choose Outside graph axis area.

### Table Graph 1

- I Right-click Kinetic Energy and choose Table Graph.
- 2 In the Settings window for Table Graph, locate the Data section.
- 3 From the Source list, choose Evaluation group.
- 4 From the Evaluation group list, choose Evaluation: Kinetic Energy.
- 5 From the Plot columns list, choose All excluding x-axis.
- 6 Click to expand the **Legends** section. Select the **Show legends** check box.
- 7 In the Kinetic Energy toolbar, click **Plot**.
- 8 Click To Plot.

### Surface Temperature

- I In the Home toolbar, click **Add Plot Group** and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Surface Temperature in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study I/ Parametric Solutions I (sol2).
- 4 Locate the Legend section. From the Layout list, choose Outside graph axis area.

### Point Grabh 1

- I In the Model Builder window, right-click Surface Temperature and choose Point Graph.
- 2 Select Point 4 only.

- 3 In the Settings window for Point Graph, locate the y-Axis Data section.
- **4** In the **Expression** text field, type T.
- **5** From the **Unit** list, choose **degC**.
- 6 Click to expand the **Legends** section. Select the **Show legends** check box.
- 7 From the Legends list, choose Automatic.
- **8** Find the **Include** subsection. Clear the **Point** check box.
- **9** In the Surface Temperature toolbar, click  **Plot**.

### Surface Temperature

In the Model Builder window, right-click Surface Temperature and choose Duplicate.

# Surface Concentration Ethanol

- I In the Model Builder window, under Results click Surface Temperature I.
- 2 In the Settings window for ID Plot Group, type Surface Concentration Ethanol in the Label text field.

# Point Graph 1

- I In the Model Builder window, expand the Surface Concentration Ethanol node, then click Point Graph 1.
- 2 In the Settings window for Point Graph, locate the Selection section.
- 3 Click to select the Activate Selection toggle button.
- **4** Select Point 4 only.
- 5 Click Replace Expression in the upper-right corner of the y-Axis Data section. From the menu, choose Component I (compl)>Transport of Concentrated Species in Vapor> Species wEth>tcs.c\_wEth - Molar concentration - mol/m3.
- 6 In the Surface Concentration Ethanol toolbar, click Plot.

To show the figure of Glass and Table .

### Study 1/Solution 1 (3) (soll)

- I In the Results toolbar, click More Datasets and choose Solution.
- 2 In the Settings window for Solution, locate the Solution section.
- 3 From the Solution list, choose Parametric Solutions I (sol2).

- I In the Results toolbar, click has a Attributes and choose Selection.
- 2 In the Settings window for Selection, locate the Geometric Entity Selection section.
- 3 From the Geometric entity level list, choose Domain.

4 From the Selection list, choose Glass.

### Revolution Glass

- I In the Results toolbar, click More Datasets and choose Revolution 2D.
- 2 In the Settings window for Revolution 2D, type Revolution Glass in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 1/ Parametric Solutions I (3) (sol2).
- 4 Click to expand the **Revolution Layers** section. In the **Start angle** text field, type -90.

### Glass and Table

- I In the Results toolbar, click **3D Plot Group**.
- 2 In the Settings window for 3D Plot Group, locate the Data section.
- 3 From the Dataset list, choose Revolution Glass.
- 4 In the Label text field, type Glass and Table.
- 5 Locate the Data section. From the Parameter value (abv) list, choose 0.15.
- 6 From the Time (s) list, choose 100.
- 7 Locate the Plot Settings section. Clear the Plot dataset edges check box.

# Volume 1

- I Right-click Glass and Table and choose Volume.
- 2 In the Settings window for Volume, locate the Data section.
- 3 From the Dataset list, choose Revolution Glass.
- 4 Click to expand the **Title** section. From the **Title type** list, choose **None**.
- **5** Locate the **Expression** section. In the **Expression** text field, type 1.

# Material Appearance I

- I Right-click Volume I and choose Material Appearance.
- 2 In the Settings window for Material Appearance, locate the Appearance section.
- 3 From the Appearance list, choose Custom.
- 4 From the Material type list, choose Custom.
- 5 Click Define custom colors.
- 6 Set the RGB values to 239, 239, and 235, respectively.
- 7 Click Add to custom colors.
- **8** Click **Show color palette only** or **OK** on the cross-platform desktop.

- 9 Click Define custom colors.
- 10 Set the RGB values to 230, 230, and 255, respectively.
- II Click Add to custom colors.
- 12 Click Show color palette only or OK on the cross-platform desktop.
- **I3** Click **Define custom colors**.
- 14 Set the RGB values to 230, 230, and 255, respectively.
- **I5** Click **Add to custom colors**.
- **16** Click **Show color palette only** or **OK** on the cross-platform desktop.
- 17 Select the Normal mapping check box.
- **18** In the **Normal vector noise scale** text field, type 0.1.
- 19 In the Normal vector noise frequency text field, type 30.
- 20 Select the Additional color check box.
- 21 In the Noise scale text field, type 1.
- **22** In the **Noise frequency** text field, type 10.
- 23 In the Color blend text field, type 0.55.
- 24 Click Define custom colors
- **25** Set the RGB values to 16, 31, and 86, respectively.
- 26 Click Add to custom colors.
- **27** Click **Show color palette only** or **OK** on the cross-platform desktop.
- **28** In the **Transparency** text field, type 0.5.
- 29 In the Reflectance at normal incidence text field, type 0.9.
- 30 In the Surface roughness text field, type 0.25.
- **3I** In the **Metallic** text field, type 0.85.
- 32 In the Pearl text field, type 0.05.
- 33 In the Diffuse wrap text field, type 0.45.
- **34** In the **Clear coat** text field, type **0.3**.
- **35** In the **Reflectance** text field, type 0.75.

Study I/Parametric Solutions I (3) (sol2)

In the Model Builder window, under Results>Datasets right-click Study 1/

Parametric Solutions 1 (3) (sol2) and choose Duplicate.

### Selection

- I In the Model Builder window, expand the Results>Datasets>Study I/ Parametric Solutions I (4) (sol2) node, then click Selection.
- **2** Select Domain 1 only.

### Revolution Glass

In the Model Builder window, under Results>Datasets right-click Revolution Glass and choose **Duplicate**.

### Revolution Table

- I In the Model Builder window, under Results>Datasets click Revolution Glass I.
- 2 In the Settings window for Revolution 2D, type Revolution Table in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study I/ Parametric Solutions I (4) (sol2).

### Volume 2

- I In the Model Builder window, right-click Glass and Table and choose Volume.
- 2 In the Settings window for Volume, locate the Data section.
- 3 From the Dataset list, choose Revolution Table.
- **4** Locate the **Expression** section. In the **Expression** text field, type 1.
- **5** Click to expand the **Title** section. From the **Title type** list, choose **None**.

# Material Appearance 1

- I Right-click Volume 2 and choose Material Appearance.
- 2 In the Settings window for Material Appearance, locate the Appearance section.
- 3 From the Appearance list, choose Custom.
- 4 From the Material type list, choose Wood.

### Cut Plane 1

- I In the Results toolbar, click Cut Plane.
- 2 In the Settings window for Cut Plane, locate the Data section.
- 3 From the Dataset list, choose Revolution 2D 1.

#### Surface 1

- I In the Model Builder window, right-click Glass and Table and choose Surface.
- 2 In the Settings window for Surface, locate the Data section.
- 3 From the Dataset list, choose Cut Plane 1.

- 4 From the Solution parameters list, choose From parent.
- **5** Locate the **Expression** section. In the **Expression** text field, type spf.U.

Transparency I

- I Right-click Surface I and choose Transparency.
- 2 In the Settings window for Transparency, locate the Transparency section.
- 3 In the Transparency text field, type 0.4.
- 4 In the Glass and Table toolbar, click Plot.

Arrow Surface 1

- I In the Model Builder window, right-click Glass and Table and choose Arrow Surface.
- 2 In the Settings window for Arrow Surface, locate the Data section.
- 3 From the Dataset list, choose Cut Plane I.
- 4 From the Solution parameters list, choose From parent.
- **5** Locate the **Expression** section. In the **r-component** text field, type u.
- **6** In the **phi-component** text field, type v.
- 7 In the **z-component** text field, type w.
- 8 Locate the Arrow Positioning section. In the Number of arrows text field, type 300.
- 9 Locate the Coloring and Style section. From the Arrow length list, choose Logarithmic.
- 10 From the Color list, choose Black.
- II In the Glass and Table toolbar, click **Plot**.

Create a plot that evaluates the heat of vaporization of water and ethanol.

# GLOBAL DEFINITIONS

In the Model Builder window, expand the Global Definitions>Thermodynamics node.

Vapor-Liquid System I (pp I)

In the Model Builder window, expand the Global Definitions>Thermodynamics>Vapor-**Liquid System I (ppI)** node.

Heat of vaporization I (chempp I dHvap\_ethanol, chempp I dHvap\_ethanol\_Dtemperature)

- I In the Model Builder window, expand the Global Definitions>Thermodynamics>Vapor-Liquid System I (ppI)>ethanol node, then click
  - Heat of vaporization I (chemppIdHvap\_ethanol, chemppIdHvap\_ethanol\_Dtemperature).

### **GLOBAL DEFINITIONS**

Heat of vaporization 2 (chempp | dHvap\_water, chempp | dHvap\_water\_Dtemperature)

- I In the Model Builder window, expand the Global Definitions>Thermodynamics>Vapor-Liquid System I (ppI)>water node, then click
  - Heat of vaporization 2 (chempp I dHvap\_water, chempp I dHvap\_water\_Dtemperature).

### RESULTS

ID Plot Group 19

In the Model Builder window, expand the Results>ID Plot Group 19 node.

### Function I

In the Model Builder window, expand the Results>ID Plot Group 20 node, then click Function 1.

### Water

- I Drag and drop below ID Plot Group 19>Function I.
- 2 In the Settings window for Function, type Water in the Label text field.
- 3 Click to expand the Legends section. Select the Show legends check box.
- 4 From the Legends list, choose Manual.
- **5** In the table, enter the following settings:

# Legends Water

### Ethanol

- I In the Model Builder window, under Results>ID Plot Group 19 click Function 1.
- 2 In the Settings window for Function, type Ethanol in the Label text field.
- 3 Locate the Legends section. Select the Show legends check box.
- 4 From the Legends list, choose Manual.
- **5** In the table, enter the following settings:

# Legends Ethanol

Heat of Vaporization

I In the Model Builder window, under Results click ID Plot Group 19.

- 2 In the Settings window for ID Plot Group, type Heat of Vaporization in the Label text
- 3 Click to expand the Title section. From the Title type list, choose None.
- 4 Locate the **Plot Settings** section.
- 5 Select the y-axis label check box. In the associated text field, type Heat of Vaporization (J/kg).
- 6 Locate the Legend section. From the Position list, choose Middle right.
- 7 Locate the Axis section. Select the Manual axis limits check box.
- 8 In the y minimum text field, type -1e5.
- 9 In the y maximum text field, type 3e6.
- **10** In the **Heat of Vaporization** toolbar, click **10 Plot**.

# Appendix — Geometry Modeling Instructions

From the File menu, choose New.

# NEW

In the New window, click Blank Model.

### ADD COMPONENT

In the Home toolbar, click Add Component and choose 2D Axisymmetric.

### **GLOBAL DEFINITIONS**

### Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.
- 3 Click \ Clear Table.
- **4** In the table, enter the following settings:

Name	Expression	Value	Description
Hvdom	0.5[m]	0.5 m	Height of vapor domain
Wvdom	0.5[m]	0.5 m	Width of vapor domain
Ttable	2[cm]	0.02 m	Table thickness

### GEOMETRY I

Rectangle I (rI)

- I In the Geometry toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- 3 In the Width text field, type Wvdom.
- 4 In the **Height** text field, type Hvdom.

Point I (pt I)

- I In the Geometry toolbar, click Point.
- 2 In the Settings window for Point, locate the Point section.
- 3 In the  $\mathbf{r}$  text field, type 0.008.
- 4 In the z text field, type 0.08.

Point 2 (pt2)

- I In the **Geometry** toolbar, click **Point**.
- 2 In the Settings window for Point, locate the Point section.
- 3 In the  $\mathbf{r}$  text field, type 0.042.
- 4 In the z text field, type 0.145.

Point I (ptl), Point 2 (pt2)

- I In the Model Builder window, under Component I (compl)>Geometry I, Ctrl-click to select Point I (ptl) and Point 2 (pt2).
- 2 Right-click and choose Group.

Point 3 (pt3)

- I In the **Geometry** toolbar, click **Point**.
- 2 In the Settings window for Point, locate the Point section.
- 3 In the r text field, type 0.034.
- 4 In the z text field, type 0.2.

Point 4 (pt4)

- I In the **Geometry** toolbar, click **Point**.
- 2 In the Settings window for Point, locate the Point section.
- 3 In the r text field, type 0.036.
- 4 In the z text field, type 0.2.
- 5 Right-click Point 4 (pt4) and choose Duplicate.

# Point 5 (pt5)

- I In the Model Builder window, click Point 5 (pt5).
- 2 In the Settings window for Point, locate the Point section.
- 3 In the r text field, type 0.04.
- 4 In the z text field, type 0.145.
- 5 Right-click Point 5 (pt5) and choose Duplicate.

# Point 6 (pt6)

- I In the Model Builder window, click Point 6 (pt6).
- 2 In the Settings window for Point, locate the Point section.
- 3 In the r text field, type 0.01.
- 4 In the z text field, type 0.08.
- 5 Right-click Point 6 (pt6) and choose Duplicate.

# Point 7 (5t7)

- I In the Model Builder window, click Point 7 (pt7).
- 2 In the Settings window for Point, locate the Point section.
- 3 In the  $\mathbf{r}$  text field, type 0.003.
- 4 In the z text field, type 0.038.
- 5 Right-click Point 7 (pt7) and choose Duplicate.

# Point 8 (pt8)

- I In the Model Builder window, click Point 8 (pt8).
- 2 In the Settings window for Point, locate the Point section.
- 3 In the r text field, type 0.042.
- 4 In the z text field, type 0.
- 5 Right-click Point 8 (pt8) and choose Duplicate.

# Point 9 (pt9)

- I In the Model Builder window, click Point 9 (pt9).
- 2 In the Settings window for Point, locate the Point section.
- 3 In the r text field, type 0.
- 4 In the z text field, type 0.08.

# Group 1: Points

I In the Model Builder window, click Group I.

- 2 In the Settings window for Group, type Group 1: Points in the Label text field.
- 3 Click Build All Objects.

# Polygon I (boll)

- I In the Geometry toolbar, click / Polygon.
- 2 In the Settings window for Polygon, locate the Object Type section.
- 3 From the Type list, choose Open curve.
- **4** Locate the **Coordinates** section. In the table, enter the following settings:

r (m)	z (m)
0.01	0.08
0.008	0.079
0.006	0.078
0.005	0.076
0.004	0.064
0.003	0.038
0.003	0.022
0.0048404261469841	0.016
0.0062340328097343425	0.012
0.008117016404867172	0.01
0.01	0.008
0.01396806538105011	0.006
0.042	0
0	0
0	0.08
0.008	0.08

# Circular Arc I (cal)

- I In the Geometry toolbar, click \* More Primitives and choose Circular Arc.
- 2 In the Settings window for Circular Arc, locate the Properties section.
- 3 From the Specify list, choose Endpoints and radius.
- 4 Locate the Starting Point section. In the r text field, type 0.008.
- 5 In the z text field, type 0.08.
- 6 Locate the Endpoint section. In the r text field, type 0.034.
- 7 In the z text field, type 0.2.
- 8 Locate the Radius section. In the Radius text field, type 0.11446.

Line Segment I (Is I)

- I In the Geometry toolbar, click \* More Primitives and choose Line Segment.
- 2 In the Settings window for Line Segment, locate the Starting Point section.
- **3** From the **Specify** list, choose **Coordinates**.
- 4 In the r text field, type 0.034.
- 5 In the z text field, type 0.2.
- **6** Locate the **Endpoint** section. From the **Specify** list, choose **Coordinates**.
- 7 In the  $\mathbf{r}$  text field, type 0.036.
- 8 In the z text field, type 0.2.

Circular Arc I (cal)

In the Model Builder window, right-click Circular Arc I (cal) and choose Duplicate.

Circular Arc 2 (ca2)

- I In the Model Builder window, click Circular Arc 2 (ca2).
- 2 In the Settings window for Circular Arc, locate the Starting Point section.
- 3 In the r text field, type 0.01.
- 4 Locate the **Endpoint** section. In the r text field, type 0.036.

Union I (uni I)

- I In the Geometry toolbar, click Booleans and Partitions and choose Union.
- 2 Select the objects cal, ca2, ls1, and poll only.
- 3 In the Settings window for Union, click Build All Objects.

Convert to Solid I (csoll)

- I In the Geometry toolbar, click Conversions and choose Convert to Solid.
- **2** Select the object **unil** only.
- 3 In the Settings window for Convert to Solid, click **Build All Objects**.

Fillet I (fill)

- I In the Geometry toolbar, click Fillet.
- **2** On the object **csoll**, select Points 16 and 17 only.
- 3 In the Settings window for Fillet, locate the Radius section.
- 4 In the Radius text field, type 0.9[mm].

Polygon 2 (pol2)

I In the Geometry toolbar, click / Polygon.

- 2 In the Settings window for Polygon, locate the Coordinates section.
- **3** In the table, enter the following settings:

r (m)	z (m)
0	0.08
0.008	0.08
0.01859369918701851	0.09
0.032	0.1133
0	0.1133
0	0.08

# Difference I (dif1)

- I In the Geometry toolbar, click Booleans and Partitions and choose Difference.
- 2 Select the object pol2 only.
- 3 In the Settings window for Difference, locate the Difference section.
- **4** Click to select the **Activate Selection** toggle button for **Objects to subtract**.
- **5** Select the object **fill** only.
- 6 Select the Keep objects to subtract check box.

# Polygon 3 (pol3)

- I In the Geometry toolbar, click / Polygon.
- 2 In the Settings window for Polygon, locate the Coordinates section.
- **3** In the table, enter the following settings:

r (m)	z (m)
0	0.1133
0.032	0.1133
0.0365	0.124
0	0.124

# Difference I (dif1)

In the Model Builder window, right-click Difference I (dif1) and choose Duplicate.

### Difference 2 (dif2)

- I In the Model Builder window, click Difference 2 (dif2).
- 2 In the Settings window for Difference, locate the Difference section.
- 3 Click to select the Activate Selection toggle button for Objects to add.

**4** Select the object **pol3** only.

# Rectangle 2 (r2)

- I In the Geometry toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- 3 In the Width text field, type Wvdom.
- 4 In the **Height** text field, type Ttable.
- **5** Locate the **Position** section. In the **z** text field, type -Ttable.

# Line Segment 2 (Is2)

- I In the Geometry toolbar, click More Primitives and choose Line Segment.
- 2 In the Settings window for Line Segment, locate the Starting Point section.
- 3 From the Specify list, choose Coordinates.
- 4 In the r text field, type 0.017.
- 5 In the z text field, type 0.21.
- 6 Locate the Endpoint section. From the Specify list, choose Coordinates.
- **7** In the **r** text field, type **0.017**.
- 8 In the z text field, type Hvdom\*0.98.

## Line Segment 3 (Is3)

- I In the Geometry toolbar, click \* More Primitives and choose Line Segment.
- 2 In the Settings window for Line Segment, locate the Starting Point section.
- 3 From the Specify list, choose Coordinates.
- 4 In the r text field, type 0.05.
- 5 In the z text field, type 0.05.
- 6 Locate the Endpoint section. From the Specify list, choose Coordinates.
- 7 In the r text field, type Wvdom\*0.97.
- **8** In the **z** text field, type 0.05.

# Delete Entities I (del1)

- I In the Model Builder window, right-click Geometry I and choose Delete Entities.
- 2 In the Settings window for Delete Entities, locate the Entities or Objects to Delete section.
- 3 From the Geometric entity level list, choose Point.
- 4 On the object pt3, select Point 1 only.
- 5 On the object **pt4**, select Point 1 only.

6 Click **Build All Objects**.

Form Union (fin)

In the Geometry toolbar, click **Build All**.

Merge Vertices I (mrv1)

- I In the Geometry toolbar, click \times Virtual Operations and choose Merge Vertices.
- 2 In the Settings window for Merge Vertices, locate the Vertex to Keep section.
- 3 Click to select the Activate Selection toggle button for Vertex to keep.
- **4** On the object **fin**, select Point 25 only.
- 5 Locate the Vertex to Remove section. Click to select the Activate Selection toggle button for Vertex to remove.
- **6** On the object **fin**, select Point 26 only.
- 7 In the Geometry toolbar, click **Build All**.

Mesh Control Edges I (mcel)

- I In the Geometry toolbar, click \times Virtual Operations and choose Mesh Control Edges.
- 2 On the object mrv1, select Boundaries 10, 24, and 26 only.

# Beverage

- I In the Geometry toolbar, click \( \frac{1}{2} \) Selections and choose Explicit Selection.
- 2 In the Settings window for Explicit Selection, type Beverage in the Label text field.
- 3 On the object mce1, select Domain 3 only.

### Glass

- I In the Geometry toolbar, click \( \frac{1}{2} \) Selections and choose Explicit Selection.
- 2 In the Settings window for Explicit Selection, type Glass in the Label text field.
- 3 On the object mcel, select Domain 2 only.

### Vabor/Air

- I In the Geometry toolbar, click \( \frac{1}{2} \) Selections and choose Explicit Selection.
- 2 In the Settings window for Explicit Selection, type Vapor/Air in the Label text field.
- 3 On the object mcel, select Domain 4 only.

### Table

- I In the Geometry toolbar, click \( \frac{1}{2} \) Selections and choose Explicit Selection.
- 2 In the Settings window for Explicit Selection, type Table in the Label text field.
- 3 On the object mcel, select Domain 1 only.

# Vapor-Liquid Surface

- I In the Geometry toolbar, click \( \frac{1}{2} \) Selections and choose Explicit Selection.
- 2 In the Settings window for Explicit Selection, type Vapor-Liquid Surface in the Label text field.
- 3 Locate the Entities to Select section. From the Geometric entity level list, choose Boundary.
- 4 On the object mcel, select Boundary 8 only.
- 5 In the Geometry toolbar, click **Build All**.
