

Discharging Tank

This tutorial model illustrates how to calculate the pressure drop and initial flow rate in a pipe system connected to water tank. The Pipe Flow interface contains ready-to-use friction models accounting for the surface roughness of pipes as well as energy losses in bends and valves.

Model Definition

Water from a tank flows through a total of 105 m of pipe to be discharged through an open ball valve. The pipes are 15 cm in diameter and made out of galvanized iron. The water level is 10 m above the point of discharge.

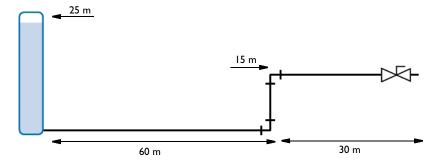

Figure 1: Water flows through a pipe system with two 90° bends and discharges through an open ball valve.

The model example is taken from Ref. 1.

THE MOMENTUM EQUATION

Inside a stretch of pipe section, the momentum balance solved is:

$$\nabla p + \rho \mathbf{u} \cdot \nabla \mathbf{u} = -f_{\mathrm{D}} \frac{\rho}{2d_{\mathrm{h}}} \mathbf{u} |\mathbf{u}| + \mathbf{F}$$
 (1)

and the continuity equation

$$\nabla \cdot (A \rho \mathbf{u}) = 0 \tag{2}$$

The term on the left-hand side of Equation 1 is the pressure gradient along the tangential direction (flow direction) of a pipe stretch. The first term on the right-hand side represents the pressure drop due to viscous shear. $f_{\rm D}$ is the Darcy friction factor, $d_{\rm h}$ is the hydraulic diameter and ${\bf u}$ is the velocity mean value across a pipe cross section. ${\bf F}$ is a volume force

term (SI unit: N/m^3), in this case used to account for gravity. ρ and A in Equation 2 are fluid density (kg/m^3) and cross section area (m^3) , respectively. To find out more about these equations and variables, please refer to the section *Theory for the Pipe Flow Interface* in the *Pipe Flow Module User's Guide*.

Expressions for the Darcy Friction Factor

The Pipe Flow interface provides a library of built-in expressions for the Darcy friction factor, f_D . This example uses the Churchill relation (Ref. 2) that is valid for laminar flow, turbulent flow, and the transitional region in between these regimes. The Churchill relation is:

$$f_{\rm D} = 8 \left[\left(\frac{8}{\text{Re}} \right)^{12} + (A+B)^{-1.5} \right]^{1/12}$$

where

$$A = \left[-2.457 \ln \left(\left(\frac{7}{\text{Re}} \right)^{0.9} + 0.27 (e/d) \right) \right]^{16}$$

$$B = \left(\frac{37530}{\text{Re}} \right)^{16}$$

As seen from the equations above, the friction factor is a function of the surface roughness divided by diameter of the pipe. Surface roughness data can be selected from a predefined list in the Pipe Properties feature.

The Churchill equation is also a function of the fluid properties and flow type, and geometry, through the Reynolds number:

$$Re = \frac{\rho u d}{\mu}$$

The physical properties of water as function of temperature are directly available from the software's built-in material library.

Additional Flow Resistances

In pipe networks, fittings, bends, valves, and so on, induce additional energy losses

$$\Delta p_{\text{tot}} = \frac{1}{2} K_i u^2$$

characterized by loss coefficients, K_i . The Pipe Flow interface can include such resistances through the point features. This model uses two 90° bends and a Ball valve.

BOUNDARY CONDITIONS

At the pipe inlet from the tank, see Figure 1, the pressure is taken as the atmospheric pressure at the top water surface in the tank plus the hydrostatic pressure due to the water column:

$$p_{\text{res}} = p_0 + \rho g h$$

where g is the normal gravitational acceleration (m/s^2) and the h the elevation height (m), the latter which is 25 m in this case. The entrance from the tank is rounded.

At the system outlet to the right, atmospheric pressure p_0 is specified.

Results and Discussion

Figure 2 shows the pressure drop over the pipe system, while Figure 3 shows the direction of flow and the fluid velocity.

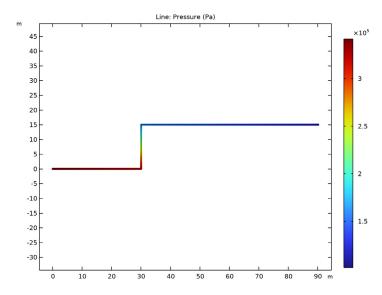

Figure 2: Pressure drop across the pipe system.

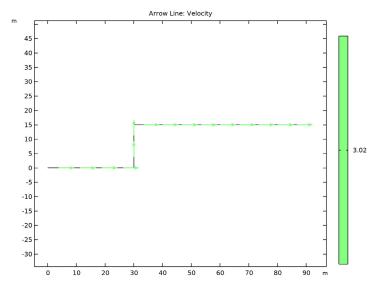

Figure 3: The fluid velocity is constant at approximately 3 m/s.

The initial discharge rate is calculated to approximately $0.053 \text{ m}^3/\text{s}$. A check of the Reynolds number produces Re = $4.47 \cdot 10^5$ and indicates that the flow is well in the turbulent regime.

 $\textbf{Application Library path:} \ \texttt{Pipe_Flow_Module/Tutorials/discharging_tank}$

Modeling Instructions

From the File menu, choose New.

NEW

In the New window, click Model Wizard.

MODEL WIZARD

- I In the Model Wizard window, click **2D**.
- 2 In the Select Physics tree, select Fluid Flow>Single-Phase Flow>Pipe Flow (pfl).
- 3 Click Add.
- 4 Click 🔵 Study.
- 5 In the Select Study tree, select General Studies>Stationary.
- 6 Click M Done.

GEOMETRY I

Polygon I (poll)

- I In the Geometry toolbar, click / Polygon.
- 2 In the Settings window for Polygon, locate the Object Type section.
- 3 From the Type list, choose Open curve.
- **4** Locate the **Coordinates** section. In the table, enter the following settings:

x (m)	y (m)
0	0
30	0
30	15
90	15
90.1	15

MATERIALS

Now add Water from the Material Library. The material properties will apply to the entire model domain by default.

ADD MATERIAL

- I In the Home toolbar, click **‡ Add Material** to open the Add Material window.
- 2 Go to the Add Material window.
- 3 In the tree, select Built-in>Water, liquid.
- 4 Click Add to Component in the window toolbar.
- 5 In the Home toolbar, click **‡ Add Material** to close the **Add Material** window.

MATERIALS

Water, liquid (mat I)

Click the **Zoom Extents** button in the **Graphics** toolbar.

PIPE FLOW (PFL)

Next, specify the dimensions and surface roughness of the pipe. Note that you can add multiple Pipe Properties features and assign them to different parts of a pipe network, should you have a system of made up of pipes with different characteristics.

Pipe Properties 1

- I In the Model Builder window, under Component I (compl)>Pipe Flow (pfl) click Pipe Properties 1.
- 2 In the Settings window for Pipe Properties, locate the Pipe Shape section.
- 3 From the list, choose Circular.
- 4 In the d_i text field, type 15 [cm].
- 5 Locate the Flow Resistance section. From the Surface roughness list, choose Galvanized iron (0.15 mm).

Set boundary conditions for the inlet and use a Volume Force feature to take gravity effects into account.

- I In the Physics toolbar, click Points and choose Inlet.
- 2 In the Settings window for Inlet, locate the Inlet Specification section.
- 3 From the Specification list, choose Reservoir.
- 4 In the p_{res} text field, type 101325[Pa]+(25[m])*g_const*pfl.rho.
- **5** Select Point 1 only.
- 6 From the Entrance type list, choose Rounded (K = 0.05).

Volume Force 1

- I In the Physics toolbar, click Boundaries and choose Volume Force.
- 2 Select Boundaries 1–3 only. The default volume force is a gravity vector pointing in the negative y direction (downward).
- 3 Click the **Zoom Extents** button in the **Graphics** toolbar.

Next, add a number of point features to include the energy losses due to bends and the ball valve. The valve point may be difficult to select graphically with the mouse. Here, you can use the Selection list, as help to browse the points in a list.

Bend I

- I In the Physics toolbar, click Points and choose Bend.
- 2 Select Points 2 and 3 only.

Valve I

- I In the Physics toolbar, click Points and choose Valve.
- 2 Select Point 4 only.
- 3 In the Settings window for Valve, locate the Valve Specification section.
- 4 From the Valve list, choose Ball valve (K = 4.5).

To help graphically indicate locations of pipe network elements, the physics symbols are available.

- 5 In the Model Builder window, click Pipe Flow (pfl).
- 6 In the Settings window for Pipe Flow, locate the Physics Symbols section.
- 7 Select the Enable physics symbols check box.
- 8 Find the Show or hide all physics symbols subsection. Click Select All to display physics symbols for all features.

STUDY I

The model is now ready for solving. Lower the default tolerance to increase the accuracy of the solution.

Solution I (soll)

- 2 In the Model Builder window, expand the Solution I (soll) node, then click Stationary Solver 1.
- 3 In the Settings window for Stationary Solver, locate the General section.
- 4 In the Relative tolerance text field, type 1e-6.
- 5 In the Study toolbar, click **Compute**.

RESULTS

Velocity (pfl)

Default plots show the pressure drop in the pipe system, and the direction and velocity of the flow (Figure 2 and Figure 3). Now select from predefined plot quantities to evaluate the volumetric flow rate and the Reynolds number.

I In the Model Builder window, expand the Velocity (pfl) node.

Color Expression 1

- I In the Model Builder window, expand the Results>Velocity (pfl)>Arrow Line I node, then click Color Expression 1.
- 2 In the Settings window for Color Expression, click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)> Pipe Flow>pfl.Re - Reynolds number - I.
- 3 Click to expand the Title section. From the Title type list, choose Automatic.
- 4 In the Velocity (pfl) toolbar, click Plot.
