

# Loudspeaker Driver — Frequency-Domain Analysis

This example shows how to model a loudspeaker driver of the dynamic cone type, common for low and medium frequencies. The analysis is carried out in the frequency domain and thus represents the linear behavior of the driver. The instructions walk you through modeling its electromagnetic, structural, and acoustic properties. The output from the model includes the total electric impedance and the sensitivity (the on-axis sound pressure level at a nominal driving voltage) as functions of the frequency. The spatial characteristics of the speaker are depicted in a directivity plot.

When performing the acoustic measurements in this model, the driver is set up in an infinite baffle — a wide reflective surface acting to shut out the sound produced on the backside of the cone. Two extended 3D version of the model exist: the Loudspeaker Driver in a Vented Enclosure, uses the lumped electromechanical properties modeled here and adds a vented enclosure (the driver is placed in a cabinet); and the Loudspeaker Driver in 3D — Frequency-Domain Analysis model solves a full electro-vibroacoustic multiphysics version of the driver in 3D.

The model is set up with a combination of the Magnetic Fields interface from the AC/ DC Module and the Acoustic-Structure Interaction multiphysics interface from the Acoustics Module. The Lorentz Coupling multiphysics feature is used for handling the electromagnetic forces and induced currents over the voice coil. A first optional analysis solves only the electromagnetic part of the problem, with the driver in stand-still. From here, a driving force factor and the blocked voice coil impedance can be extracted and exported. The second analysis is of the full model, including the relevant multiphysics interactions all the way from the driving voltage to the computed sound pressure level.

A third optional analysis shows what is the effect of not considering the thermoviscous losses in the voice coil gap area. These losses are relevant around the frequencies where back cavity modes appear. The fourth and final analysis is an eigenfrequency analysis of the structure, showing the frequency and shape of the main structural modes of the speaker.

**Note:** This model requires the both the Acoustics Module and the AC/DC Module.

# Model Definition

Figure 1 shows the geometry of the baffled driver with its functional parts. The field from the magnet is supported and focused by the iron pole piece and top plate to the thin gap where the *voice coil* is wound around a former extending from the apex of the *cone*. Although the voice coil consists of many turns of wire, it is for simplicity drawn and modeled as a homogenized domain. When a driving AC voltage is applied to the voice coil, the resulting force causes it to vibrate, and the cone to create sound.

The *dust cap* protects the magnetic motor. In this design, it is made of the same stiff and light composite material as the cone and also contributes to the sound. A centered hole in the pole piece counteracts pressure buildup beneath the dust cap. The *suspension*, consisting of the *surround*, made of a light foam material, and the *spider*, a flexible cloth, keep the cone in place and provide damping and spring forces.

The outer perimeters of the magnet and suspension are normally attached to a *basket*, a hollow supporting metal structure. The basket is not included in this model, but the magnet assembly and outer rims of the spider and surround are considered to be fixed. The omission of the basket means that the considered geometry is rotationally symmetric and can be modeled in the *rz*-plane.

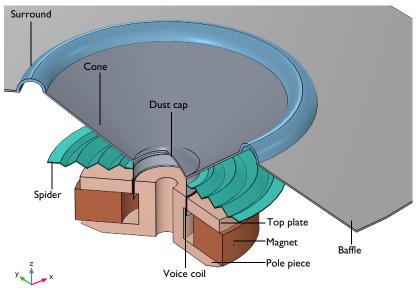

Figure 1: Geometry of the modeled loudspeaker driver.

The loudspeaker is driven by a time-harmonic voltage,  $V = V_0 \exp(i\omega t)$ , applied to the voice coil. The following theory section first describes the electromagnetic analysis of the current in the voice coil and the driving force that this current gives rise to. The relation

between the driving voltage and the force on the voice coil as well as the so-called back EMF are easily set up in COMSOL using built-in functionality. This force is then applied in an acoustic-structure interaction analysis to compute the sound generation. More details are given in the section Electromagnetic Interactions.

The structural equation is solved in the moving parts of the driver, and a pressure acoustics equation in the surrounding air. The pressure acoustics equation is automatically excited by the structural vibrations, and feeds back the pressure load onto the structure, using the built-in Acoustic-Structure Boundary multiphysics coupling. In the narrow gap between the pole piece and the voice coil (the magnetic gap) damping occurs due to thermal and viscous boundary-layer losses. These losses are captured here using the Narrow Region Acoustics feature available in pressure acoustics. The gap is well approximated by a slit of constant cross section area. The effect of the damping is illustrated in the Results and Discussion section below.

The air domains and the baffle should ideally extend to infinity. To avoid unphysical reflections where you truncate the geometry, you use a perfectly matched layer (PML), as seen in Figure 2. For more information about PMLs in acoustics, see the section Modeling with the Pressure Acoustics Branch (FEM-Based Interfaces) in the Acoustics Module User's Guide.

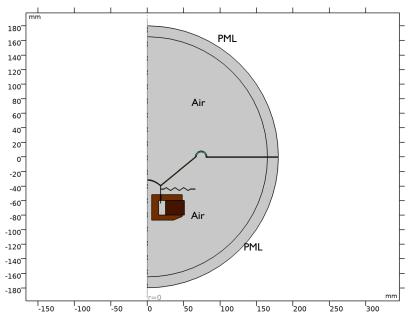

Figure 2: Overview of the model geometry.

Although the modeled air domain has a radius of only 165 mm, the local acoustic pressure and phase can be extracted anywhere outside the computational domain by using the exterior-field pressure computations. The sensitivity is calculated as the sound pressure level on the axis at a radius of 1 m, for the applied voltage  $V_0 = 3.55 \, \text{V}$ . This functionality also allows postprocessing the directivity plot for the speaker, again evaluated at 1 m.

#### **ELECTROMAGNETIC INTERACTIONS**

The Lorentz force on a wire of length L and with the current  $\mathbf{I}$  in an externally generated magnetic flux density  $\mathbf{B}$  perpendicular to the wire is given by  $F = L\mathbf{I} \times \mathbf{B}$ . The voice coil consists of a single copper wire making  $N_0 = 100$  turns. The coil is homogenized so that

$$N_0 I = \int_A J_{\phi} dA$$

where  $J_{\phi}$  is the azimuthally directed current density through a cross-section of the coil, and the integral is taken over its area in the rz-plane. The total driving force on the coil hence becomes

$$F_{\rm e} = -\int_{V} J_{\phi} B_r \mathrm{d}V \tag{1}$$

with  $B_r$  being the r-component of the magnetic flux density, and the integral evaluated over the volume occupied by the coil domain. The Lorentz force is applied to the voice coil through the *Lorentz Coupling* multiphysics feature.

The current through the voice coil relates to the applied voltage as

$$I = (V_0 + V_{be})/Z_b (2)$$

where  $Z_{\rm b}$  is the *blocked electric impedance* (the electric impedance of the voice coil measured while the speaker's moving parts are stationary) and  $-V_{\rm be}$  denotes the *back EMF* (the voltage induced in the coil due to its motion through the permanent magnetic field in the gap). The back EMF is also automatically added to the voice coil using the *Lorentz Coupling* multiphysics feature.

# **EXPORT OF LUMPED ELECTROMAGNETIC PARAMETERS**

Lumped parameters that represent the driver can be derived and used for larger system simulations. The force factor BL and the blocked electric impedance of the coil are computed. They are used in the Loudspeaker Driver in a Vented Enclosure tutorial model to set up a lumped electromagnetic equivalent to drive the speaker.

If you write Equation 1 in terms of the coil current I rather than the cross-sectional current density, you get

$$F_e = -\frac{2\pi I N_0}{A} \int r B_r dA \tag{3}$$

as it is assumed that  $J_{\phi} = I \cdot N_0 / A$  and is constant in the coil cross-section of area A. The common factor in the expression for  $F_{\rm e}$  and  $V_{
m be}$  is the force factor BL, defined as

$$BL = -\frac{2\pi N_0}{A} \int r B_r dA \tag{4}$$

Note that if  $A \to 0$ , the integral becomes equal to a magnetic flux density times the length of the coil; hence the name.

With knowledge of BL and the frequency-dependent  $Z_b$ , Equation 2, Equation 3, and Equation 4 can be rearranged to form a relationship between the driving voltage  $V_0$  and the force acting on the voice coil

$$F_{\rm e} = \frac{\rm BL}V_0}{Z_{\rm b}} - v \frac{\rm (BL)^2}{Z_{\rm b}}$$

This is the expression used as the driving force in the Loudspeaker Driver in a Vented Enclosure model. Note the dependence on the velocity v of the moving coil, which is unknown prior to modeling the acoustic-structure interaction (ASI) problem.

# Results and Discussion

The magnetic field in and around the magnetic motor is depicted in Figure 3. The maximum field in the air arises in the gap between the pole piece and the top plate (the magnetic gap where the voice coil is located). Performing the integral in Equation 4 over the voice coil domain gives a force factor BL = 10.48 N/A.

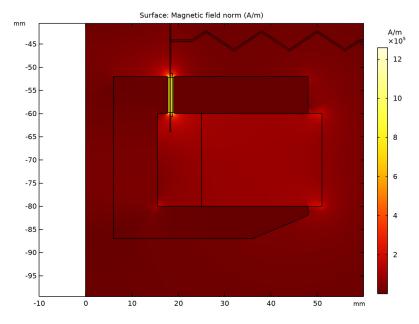

Figure 3: Magnetic field in and around the magnetic motor.

The iron in the pole piece and the top plate is modeled as a nonlinear magnetic material, with the relationship between the B and H fields described by interpolation from measured data. Figure 4 shows the local effective relative permeability  $\mu_r = B/(\mu_0 H)$ . The plot shows that the iron is close to saturation in the center of the pole piece, but remains in the linear regime above and below the magnet. This indicates that if you want to use less material, you can likely decrease the radius of the pole piece and top plate with very little effect on the magnetic field in the gap.

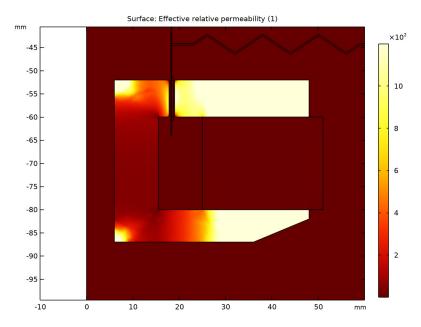

Figure 4: The local relative permeability in the pole piece and top plate, when subjected to the field from the magnet.

In computing the blocked coil impedance, the AC equation is linearized around the local permeability resulting from the static solution. Figure 5 shows the induced currents at a frequency of 50 Hz and 900 Hz. With increasing frequency, it is evident that the so-called skin depth decreases as expected.

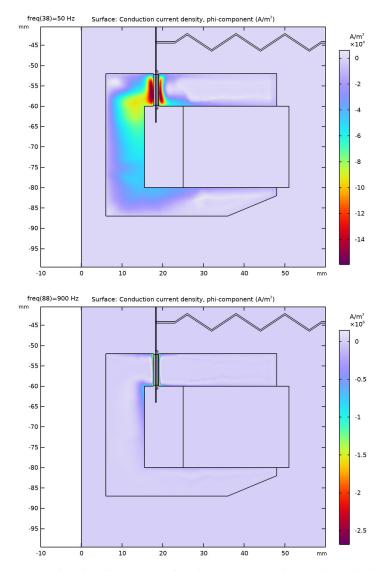

Figure 5: Induced currents in the pole piece and top plate at 50~Hz~(top) and 900~Hz~(bottom).

As seen at the higher frequency in Figure 5, the skin effect brings the currents closer to the surfaces. This causes the inductance as well as the resistive part of the impedance to change with the frequency. Figure 6 shows a plot of the blocked coil inductance versus frequency.

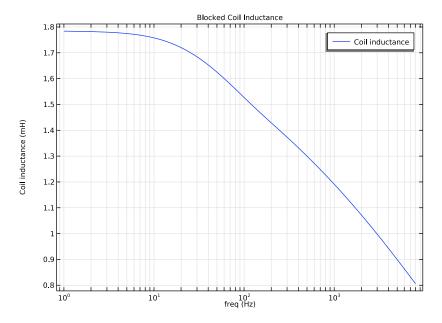

Figure 6: The inductance of the blocked coil as a function of frequency.

From the full electroacoustic-structure interaction analysis, Figure 7 shows the sound pressure level and displacement distribution at 8000 Hz. As the frequency of the excitation increases, it becomes possible to excite structural modes where different parts of the cone move at phases differing more than ±90°. This effect, called cone breakup, reduces the acoustic efficiency of the speaker, as different parts of the cone will produce acoustic pressures of opposite sign. Using an eigenfrequency study pinpoints at which frequencies the different breakup modes appear. At lower frequencies, the sound pressure level is rather evenly distributed with peaks in the on-axis direction.

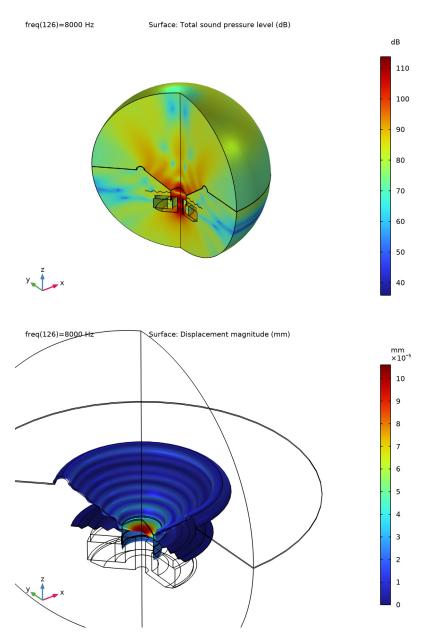

Figure 7: Sound pressure level (top) and displacement distribution (bottom) at 8000 Hz.

Figure 8 presents the loudspeaker's sensitivity depicted both in 1/3 octave bands and as a continuous curve. The plot is realized using the specialized Octave Band plot available in the Acoustics Module. The preferred operating range is where the response is rather flat — that is, roughly in the range 100 Hz-1500 Hz. A vented enclosure can extend the range to lower frequencies, as shown in the tutorial model Loudspeaker Driver in a Vented Enclosure.

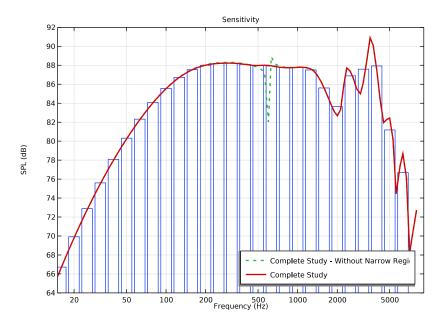

Figure 8: Loudspeaker sensitivity, measured as the on-axis sound pressure level (dB) at a distance of 1 m from the unit. The pressure is evaluated using an input signal of 3.55 V, or 2.51 V RMS, which corresponds to a power of 1 W at an 6.3  $\check{\Omega}$ . nominal impedance. Note the logarithmic frequency scale.

The plot in Figure 8 also shows the damping effect of the thermoviscous losses in the narrow gap between the voice coil and pole piece/top plate. In this setup one of the boundaries is moving (the voice coil), which is not fully compatible with the narrow region acoustics that assumes fixed boundaries. The error made is small. This can be seen by using the full thermoviscous acoustic physics interface in the narrow domain. The sensitivity is plotted both with (red curve) and without (green dotted) the losses included, captured using the Narrow Region Acoustics feature. If these are not considered, the back cavity mode around 600 Hz, will be shown in the sensitivity curve as steep resonances (green dotted curve). This mode can also be identified through the sudden shift of phase in the back cavity pressure as depicted in Figure 9.

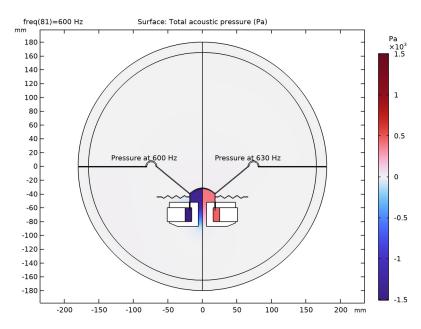

Figure 9: Acoustic pressure below and above the back cavity mode for the lossless model.

The total electric impedance, defined as  $Z = V_0/I$ , is depicted in Figure 10 (absolute, real, and imaginary parts are plotted). The features of this plot are very characteristic of loudspeaker drivers. The peak at approximately 50 Hz coincides with the mechanical resonance; at this frequency the reactive part of the impedance switches sign from inductive to capacitive. In most of the operational range the impedance is largely resistive. Between 100 Hz and 1 kHz it varies only between 6.3  $\Omega$  and 10.4  $\Omega$ . These are typical values for speakers with a nominal impedance of  $6.3 \Omega$ , as the nominal impedance is usually taken to represent a mean value over the usable frequency range, which for this driver extends between somewhat below 100 Hz and above 1 kHz. The DC resistance is the value as the frequency goes to 0 Hz, it has a value of 5.6  $\Omega$ . At frequencies higher than 1 kHz, the impedance continues to increase as the inductance of the voice coil starts playing a more important part.

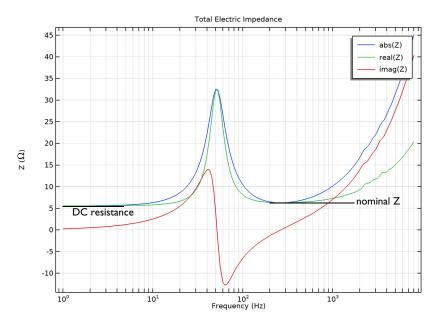

Figure 10: Electric impedance  $(\Omega)$  of the loudspeaker as a function of frequency (Hz).

The deformation of the speaker depicted in Figure 7 indicates that one or more breakup modes are active at high frequencies. The eigenfrequency analysis performed in the last study step shows the main mode affecting the structure. Due to the small influence of the acoustic pressure or the magnetic field in the frequency at which these modes appear, the analysis considers only the Solid Mechanics physics (the structure). The main modes, depicted in Figure 11, show that the first mode of the speaker appears slightly above 50 Hz, while the first breakup mode appears at around 2350 Hz. In the present case, only rotationally symmetric breakups can be modeled (the speaker is analyzed in 3D in the Loudspeaker Driver in a Vented Enclosure model).

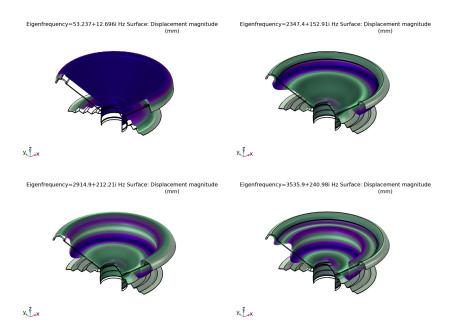

Figure 11: Main structural modes of the loudspeaker driver.

Figure 12, finally, shows a directivity plot of the spatial speaker response. This is created using the dedicated *Directivity* plot available with the Acoustics Module. The plot shows a contour representation of the spatial response (measured on a half sphere in front of the speaker) versus the frequency. Directivity plots help analyze when sidelobes occur and how they fall off. Several options, for example for the normalization and for switching the axes, are included. The plot in Figure 12 is normalized with respect to the level at  $0^{\circ}$ .

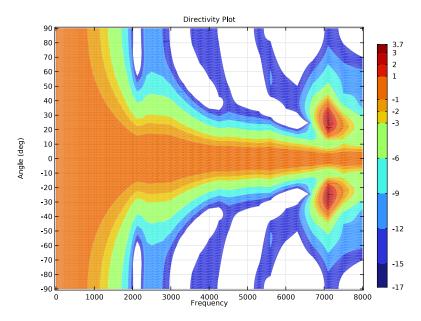

Figure 12: Directivity plot of the spatial speaker response.

# Notes About the COMSOL Implementation

The step-by-step instructions take you through the following steps:

- Import the geometry and enter model parameters.
- Apply material settings.
- Set up the physics.
- Create a study computing first the static magnetic field from the permanent magnet, then the time-harmonic fields created by the voice coil over a range of frequencies.
- (Optional) Run the study to extract the force factor, BL, and the blocked coil impedance,  $Z_{\rm b}$ .
- Copy and extend the study to include the acoustic-structure interaction.
- Solve to compute the sound pressure level and the total electric impedance of the driver over the same frequency range.

- (Optional) Set up a study considering all the physics but disable the Narrow Region
  Acoustics features.
- (Optional) Create and run an eigenfrequency analysis to locate the main structural modes of the loudspeaker.

# POLE PIECE AND TOP PLATE MATERIAL

The iron used in the pole piece and top plate is a nonlinear magnetic material, with interpolation data describing the relationship between the B and H fields. Among other output, the static solution provides the local permeability, as shown in Figure 4.

# PERTURBATION ANALYSIS

The studies in this model have a Stationary study step followed by a Frequency Domain, Perturbation step. This automatically makes the stationary solution the linearization point for the subsequent frequency domain solution. This means that the Magnetic Fields interface derives and uses a differential permeability inherited from the one computed by the stationary study. For the frequency domain assumption to be strictly valid, the applied AC voltage must be so small that the resulting current creates a magnetic field which does not significantly alter this permeability. Even though this is not quite the situation here, linearizing around a local biased permeability should still be a better approximation than assuming a constant permeability. The most accurate way to compute the impedance would be in a fully transient analysis, which is outside the scope of this model.

The coil is driven with a voltage set to linper(V0). The linper() operator ensures that the driving voltage V0 is applied only in the Frequency Domain, Perturbation study step.

#### MULTIPHYSICS

The Acoustic-Structure Interaction multiphysics interface sets up the pressure acoustics and the solid mechanics interfaces together with the Acoustic-Structure Boundary multiphysics coupling. The multiphysics coupling (under the Multiphysics node) automatically provides and assigns the boundary conditions for the two-way acoustic-structural coupling between the air and the structures. The acoustic-structure interaction is solved for only in the Frequency Domain, Perturbation step.

The *Lorentz Coupling* multiphysics feature automatically provides and assigns the domain loads for the two-way electromagnetic-structural coupling in the coil domain.

# STRUCTURAL DAMPING

In most loudspeaker specifications, the suspension is characterized by a mechanical compliance  $C_s$  and resistance  $R_s$ . In order to keep the resistance constant over a range of frequencies, the material needs to have a damping factor that increases linearly with the

frequency or, equivalently, Rayleigh damping with  $\alpha_{\delta M} = 0$  and a constant  $\beta_{dK} = \eta/\omega_{loss}$ , where  $\eta$  is the loss factor measured at the angular frequency  $\omega_{loss}$ . In this model, the frequency where the loss factor is measured is chosen to be near the lowest mechanical resonance of the driver.

Application Library path: Acoustics\_Module/Electroacoustic\_Transducers/ loudspeaker driver

**Note:** This application also requires the file Acoustics Module/ Electroacoustic\_Transducers/loudspeaker\_driver\_materials as it contains the material definitions for Materials.

# Modeling Instructions

From the File menu, choose New.

In the New window, click Model Wizard.

# MODEL WIZARD

- I In the Model Wizard window, click 2D Axisymmetric.
- 2 In the Select Physics tree, select AC/DC>Electromagnetic Fields>Magnetic Fields (mf).
- 3 Click Add.
- 4 In the Select Physics tree, select Acoustics>Acoustic-Structure Interaction>Acoustic-Solid Interaction, Frequency Domain.
- 5 Click Add.
- 6 Click 🔁 Study.

The Model Wizard lets you select the first one of the study steps you plan to use in the model. Select a stationary study used for solving the static magnetic fields.

- 7 In the Select Study tree, select Preset Studies for Some Physics Interfaces>Stationary.
- 8 Click M Done.

#### **GEOMETRY I**

When working with your own modeling project of an acoustic driver, you will typically either draw the geometry in COMSOL Multiphysics, or import a CAD file of the driver itself and add the surrounding air and PML domains. Here, the entire geometry is imported as a sequence from the geometry file. The instructions to the geometry can be found in the appendix at the end of this document.

- I In the Geometry toolbar, click Insert Sequence and choose Insert Sequence.
- **2** Browse to the model's Application Libraries folder and double-click the file loudspeaker\_driver\_geom\_sequence.mph.
- 3 In the Geometry toolbar, click **Build All**.
- 4 Click the **Zoom Extents** button in the **Graphics** toolbar.

# **GLOBAL DEFINITIONS**

#### Parameters 1

Enter the model parameters or load them from the file loudspeaker\_driver\_parameters.txt. Here, as well as in all following sections, the Description field helps you keep track of what you are doing, but is completely optional.

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.
- **3** In the table, enter the following settings:

Name	Expression	Value	Description
NO	100	100	Number of turns in coil
V0	3.55[V]	3.55 V	Peak driving voltage
f_loss	40[Hz]	40 Hz	Frequency at which loss factor is given
omega_loss	2*pi*f_loss	251.33 Hz	Angular frequency at which loss factor is given
fmax	8[kHz]	8000 Hz	Maximal study frequency
c0	343[m/s]	343 m/s	Speed of sound in air
lamO	c0/fmax	0.042875 m	Minimum wave length

The loss factor frequency definition f\_loss will be used when setting up the structural damping properties.

Create some selections, this will simplify setting up the physics.

#### DEFINITIONS

# Soft Iron

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Soft Iron in the Label text field.
- **3** Select Domains 6 and 23 only.
- 4 Locate the Color section. From the Color list, choose Color 3.

# Composite

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Composite in the Label text field.
- **3** Select Domains 3 and 21 only.
- 4 Locate the Color section. From the Color list, choose Color 9.

# Cloth

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Cloth in the Label text field.
- 3 Select Domain 20 only.
- 4 Locate the Color section. From the Color list, choose Color 7.

#### Foam

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Foam in the Label text field.
- 3 Select Domain 25 only.
- 4 Locate the Color section. From the Color list, choose Color 10.

# Coil

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Coil in the Label text field.
- **3** Select Domains 17–19 only.
- 4 Locate the Color section. From the Color list, choose Color 8.

#### Glass Fiber

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Glass Fiber in the Label text field.
- **3** Select Domains 9–16 only.
- 4 Locate the Color section. From the Color list, choose Color 10.

# Generic Ferrite

- I In the **Definitions** toolbar, click **\( \bigcap\_{\bigcap} \) Explicit**.
- 2 In the Settings window for Explicit, type Generic Ferrite in the Label text field.
- **3** Select Domain 24 only.
- 4 Locate the Color section. From the Color list, choose Color 17.

# PML

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type PML in the Label text field.
- **3** Select Domains 1 and 5 only.

# All Domains

- I In the **Definitions** toolbar, click **a Box**.
- 2 In the Settings window for Box, type All Domains in the Label text field.

#### Air

- I In the **Definitions** toolbar, click **Difference**.
- 2 In the Settings window for Difference, type Air in the Label text field.
- 3 Locate the Input Entities section. Under Selections to add, click + Add.
- 4 In the Add dialog box, select All Domains in the Selections to add list.
- 5 Click OK.
- 6 In the Settings window for Difference, locate the Input Entities section.
- 7 Under Selections to subtract, click + Add.
- 8 In the Add dialog box, in the Selections to subtract list, choose Soft Iron, Composite, Cloth, Foam, Coil, Glass Fiber, and Generic Ferrite.
- 9 Click OK.

#### Structural Domains

- I In the **Definitions** toolbar, click  **Union**.
- 2 In the Settings window for Union, type Structural Domains in the Label text field.
- 3 Locate the Input Entities section. Under Selections to add, click + Add.
- 4 In the Add dialog box, in the Selections to add list, choose Composite, Cloth, Foam, Coil, and Glass Fiber.
- 5 Click OK.

Composite and Glass Fiber

- I In the **Definitions** toolbar, click **Union**.
- 2 In the Settings window for Union, type Composite and Glass Fiber in the Label text field.
- 3 Locate the Input Entities section. Under Selections to add, click + Add.
- 4 In the Add dialog box, in the Selections to add list, choose Composite and Glass Fiber.
- 5 Click OK.

# Magnetic Domains

- I In the **Definitions** toolbar, click **a Box**.
- 2 In the Settings window for Box, type Magnetic Domains in the Label text field.
- **3** Locate the **Box Limits** section. In the **r minimum** text field, type 0 [mm].
- 4 In the r maximum text field, type 50 [mm].
- 5 In the z minimum text field, type -90 [mm].
- 6 In the z maximum text field, type -42 [mm].

# All Domains Without the PML

- I In the **Definitions** toolbar, click Difference.
- 2 In the Settings window for Difference, type All Domains Without the PML in the Label text field.
- 3 Locate the Input Entities section. Under Selections to add, click + Add.
- 4 In the Add dialog box, select All Domains in the Selections to add list.
- 5 Click OK.
- 6 In the Settings window for Difference, locate the Input Entities section.
- 7 Under Selections to subtract, click + Add.
- 8 In the Add dialog box, select PML in the Selections to subtract list.
- 9 Click OK.

# Perfectly Matched Layer I (pml1)

I In the Definitions toolbar, click M Perfectly Matched Layer.

Use the Perfectly Matched Layers (PMLs) to model a nonreflecting condition-like behavior and avoid unphysical reflections (spurious reflections) where the sound leaves the model. This feature is also set up under **Definitions**. This makes them available for any physics interface that needs them.

2 In the Settings window for Perfectly Matched Layer, locate the Domain Selection section.

- **3** From the **Selection** list, choose **PML**.
- 4 Locate the Scaling section. In the PML scaling curvature parameter text field, type 3.

Integration | (intop!)

- I In the **Definitions** toolbar, click Nonlocal Couplings and choose Integration.

  Use this integral to compute the radiated power of the loudspeaker.
- 2 In the Settings window for Integration, locate the Source Selection section.
- 3 From the Geometric entity level list, choose Boundary.
- 4 Select Boundary 93 only.

Variables 1

- In the Model Builder window, right-click Definitions and choose Variables.
  Add two variables to compute the acoustic efficiency of the loudspeaker. The coil power exists as a predefined results variable.
- 2 In the Settings window for Variables, locate the Variables section.
- **3** In the table, enter the following settings:

Name	Expression	Unit	Description
coil_power	mf.PCoil_1		Coil power
aco_eff	<pre>-intop1(up(acpr.Ir)* nr+up(acpr.Iz)*nz)/ coil_power</pre>		Acoustic efficiency

#### MATERIALS

While the material properties used in this model are partly made up, they resemble those used in a real driver. The coil former has properties representative of glass fiber materials. The spider, acting as a spring, is made of a phenolic cloth with a much lower stiffness. The material used in the coil is taken to be lighter than copper, as the wire is insulated and does not completely fill the coil domain. The surround, finally, is a light resistive foam.

Except for air and soft Iron, the materials you will use all come from a material library created especially for this model (to be loaded from the file

loudspeaker\_driver\_materials.mph). You may notice that some of the materials will report missing properties. For example, the composite does not include any electromagnetic properties. This is fine, as you will not model the magnetic fields in the domains where the composite is used.

#### ADD MATERIAL

I In the Home toolbar, click 4 Add Material to open the Add Material window.

- 2 Go to the Add Material window.
- 3 In the tree, select Built-in>Air.
- 4 Click Add to Component in the window toolbar.
- 5 In the tree, select AC/DC>Soft Iron (With Losses).
- **6** Click **Add to Component** in the window toolbar.

#### MATERIALS

Air (mat1)

First, add air which will be present everywhere in your geometry. Next, switch to using nonlinear Iron in the pole piece and top plate.

Soft Iron (With Losses) (mat2)

- I In the Model Builder window, click Soft Iron (With Losses) (mat2).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- 3 From the Selection list, choose Soft Iron.
- 4 Right-click Soft Iron (With Losses) (mat2) and choose Browse Materials.

# MATERIAL BROWSER

- I In the Material Browser window. In the ribbon make sure to select the Materials tab and then click the Browse Materials icon.
  - The Import Material Library functionality is activated by clicking the small icon at the lower-right, below the Material Browser tree.
- 2 click The Import Material Library.
- **3** Browse to the model's Application Libraries folder and double-click the file loudspeaker\_driver\_materials.mph.
- 4 Click M Done.

#### ADD MATERIAL

- I Go to the Add Material window.
- 2 In the tree, select loudspeaker driver materials>Composite.
- 3 Click Add to Component in the window toolbar.
- 4 In the tree, select loudspeaker driver materials>Cloth.
- **5** Click **Add to Component** in the window toolbar.
- 6 In the tree, select loudspeaker driver materials>Foam.
- 7 Click Add to Component in the window toolbar.

- 8 In the tree, select loudspeaker driver materials>Coil.
- **9** Click **Add to Component** in the window toolbar.
- 10 In the tree, select loudspeaker driver materials>Glass Fiber.
- II Click Add to Component in the window toolbar.
- 12 In the tree, select loudspeaker driver materials>Generic Ferrite.
- **I3** Click **Add to Component** in the window toolbar.
- 14 In the Home toolbar, click Radd Material to close the Add Material window.

# MATERIALS

Composite (mat3)

- I In the Model Builder window, under Component I (compl)>Materials click Composite (mat3).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- **3** From the **Selection** list, choose **Composite**.

Cloth (mat4)

- I In the Model Builder window, click Cloth (mat4).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- **3** From the **Selection** list, choose **Cloth**.

Foam (mat5)

- I In the Model Builder window, click Foam (mat5).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- 3 From the Selection list, choose Foam.

Coil (mat6)

- I In the Model Builder window, click Coil (mat6).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- **3** From the **Selection** list, choose **Coil**.

Glass Fiber (mat7)

- I In the Model Builder window, click Glass Fiber (mat7).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- 3 From the Selection list, choose Glass Fiber.

Generic Ferrite (mat8)

- I In the Model Builder window, click Generic Ferrite (mat8).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- 3 From the Selection list, choose Generic Ferrite.

# MAGNETIC FIELDS (MF)

The Magnetic Fields equation needs to be solved in and around the magnetic motor. To reduce simulation time, make this physics interface active only where it is needed. You can remove all domains where you expect the magnetic field to be negligible.

- I In the Model Builder window, under Component I (compl) click Magnetic Fields (mf).
- 2 In the Settings window for Magnetic Fields, locate the Domain Selection section.
- 3 From the Selection list, choose Magnetic Domains.

Add an instance of the Ampère's Law in Solids domain feature in all Magnetic Fields domains, where the material is different from air.

Ambère's Law in Solids - Generic Ferrite

- In the Physics toolbar, click Domains and choose Ampère's Law in Solids.
- 2 In the Settings window for Ampère's Law in Solids, type Ampère's Law in Solids -Generic Ferrite in the Label text field.
- 3 Locate the Domain Selection section. From the Selection list, choose Generic Ferrite.
- 4 Locate the Constitutive Relation B-H section. From the Magnetization model list, choose Remanent flux density.
- **5** Specify the **e** vector as

0	R
0	PHI
1	Z

This setting gives a static remanent flux density equal to 0.4 T in the z direction. This will create a static magnetic field distribution in the model, providing the linearization point for the frequency domain study.

Ambère's Law in Solids - Soft Iron

- I In the Physics toolbar, click **Domains** and choose Ampère's Law in Solids.
- 2 In the Settings window for Ampère's Law in Solids, type Ampère's Law in Solids -Soft Iron in the Label text field.
- 3 Locate the Domain Selection section. From the Selection list, choose Soft Iron.

4 Locate the Constitutive Relation B-H section. From the Magnetization model list, choose B-H curve.

The B-H curve is provided by the soft iron material.

Ampère's Law in Solids - Nonconductive Solids

- I In the Physics toolbar, click **Domains** and choose Ampère's Law in Solids.
- 2 In the Settings window for Ampère's Law in Solids, locate the Domain Selection section.
- 3 From the Selection list, choose Structural Domains.
- 4 In the Label text field, type Ampère's Law in Solids Nonconductive Solids.

Coil I

- I In the Physics toolbar, click **Domains** and choose **Coil**.
- 2 In the Settings window for Coil, locate the Domain Selection section.
- **3** From the **Selection** list, choose **Coil**.
- 4 Locate the Coil section. From the Conductor model list, choose Homogenized multiturn.
- **5** Locate the **Homogenized Multiturn Conductor** section. In the N text field, type NO.
- **6** In the  $a_{\text{wire}}$  text field, type 3.5e-8[m^2].

With N0 = 100 turns, the total cross-sectional area covered by the wires will be 3.5e-6 m<sup>2</sup>. The area of the coil domain is 6e-6 m<sup>2</sup>, making the fill factor approximately 60%.

- 7 Locate the Coil section. From the Coil excitation list, choose Voltage.
- **8** In the  $V_{\rm coil}$  text field, type linper(VO).

This is the driving voltage. Because the linper() operator is used it will kick in only in the **Frequency Domain, Perturbation** study.

# PRESSURE ACOUSTICS, FREQUENCY DOMAIN (ACPR)

Select the air domains above and under the speaker as well as the PML regions.

- I In the Model Builder window, under Component I (compl) click Pressure Acoustics, Frequency Domain (acpr).
- 2 In the Settings window for Pressure Acoustics, Frequency Domain, locate the Domain Selection section.
- 3 From the Selection list, choose Air.

Exterior Field Calculation 1

I In the Physics toolbar, click — Boundaries and choose Exterior Field Calculation.

The exterior-field calculation requires a source boundary encompassing all local sound sources, and with a symmetry plane to account for the infinite baffle. After computing

the solution, you can evaluate the pressure in any point (r,z) outside the domain by entering pext(r,z).

- **2** Select Boundary 93 only.
- 3 In the Settings window for Exterior Field Calculation, locate the Exterior Field Calculation section.
- 4 From the Condition in the  $z = z_0$  plane list, choose Symmetric/ Infinite sound hard boundary.

The narrow air gaps around the voice coil have a significant effect on the damping of the back cavity modes.

# Narrow Region Acoustics 1

- I In the Physics toolbar, click **Domains** and choose Narrow Region Acoustics.
- 2 Select Domain 8 only.
- 3 In the Settings window for Narrow Region Acoustics, locate the Duct Properties section.
- 4 From the Duct type list, choose Slit.
- **5** In the h text field, type 0.4[mm].
- 6 Select Domain 8 only.
- 7 Right-click Narrow Region Acoustics I and choose Duplicate.

# Narrow Region Acoustics 2

- I In the Model Builder window, click Narrow Region Acoustics 2.
- 2 In the Settings window for Narrow Region Acoustics, locate the Domain Selection section.
- 3 Click Clear Selection.
- 4 Select Domain 22 only.
- **5** Locate the **Duct Properties** section. In the h text field, type 0.2[mm].

# SOLID MECHANICS (SOLID)

- I In the Model Builder window, under Component I (compl) click Solid Mechanics (solid).
- 2 In the Settings window for Solid Mechanics, locate the Domain Selection section.
- 3 From the Selection list, choose Structural Domains.

With the above selection, you leave out the magnet, pole piece, and top plate. You will consider these domains as perfectly rigid, by using the default sound hard wall condition on their surfaces.

Add damping to some of the solid material.

Linear Elastic Material I

In the Model Builder window, under Component I (compl)>Solid Mechanics (solid) click Linear Elastic Material I.

# Dambing I

- I In the Physics toolbar, click \_ Attributes and choose Damping.
- 2 In the Settings window for Damping, locate the Domain Selection section.
- 3 Click Clear Selection.
- 4 From the Selection list, choose Composite and Glass Fiber.
- 5 Locate the Damping Settings section. From the Damping type list, choose Isotropic loss factor.

# Linear Elastic Material I

In the Model Builder window, click Linear Elastic Material I.

# Dambing 2

- I In the Physics toolbar, click \_\_\_ Attributes and choose Damping.
- 2 In the Settings window for Damping, locate the Domain Selection section.
- 3 Click Clear Selection.
- **4** From the **Selection** list, choose **Cloth**.
- **5** Locate the **Damping Settings** section. In the  $\beta_{dK}$  text field, type 0.14/omega\_loss.

# Linear Elastic Material I

In the Model Builder window, click Linear Elastic Material 1.

# Damping 3

- I In the Physics toolbar, click Attributes and choose Damping.
- 2 In the Settings window for Damping, locate the Domain Selection section.
- 3 Click Clear Selection.
- 4 From the Selection list, choose Foam.
- **5** Locate the **Damping Settings** section. In the  $\beta_{dK}$  text field, type 0.46/omega\_loss. The spider and the surround are attached to the case.

#### Fixed Constraint I

- I In the Physics toolbar, click Boundaries and choose Fixed Constraint.
- 2 Select Boundaries 81 and 85 only.

Now is a good time to inspect Acoustic-Structure Boundary I multiphysics coupling under the **Multiphysics** node. When using a predefined multiphysics interface the coupling is automatically applied to all acoustic-solid boundaries.

Now, the Magnetomechanics multiphysics feature is added to handle Lorentz force on the coil (it represents the product of the time-harmonic current and the static magnetic field in which it is traveling). For details, see Notes About the COMSOL Implementation.

#### MULTIPHYSICS

Magnetomechanics I (mmcpl1)

- I In the Physics toolbar, click And Multiphysics Couplings and choose Domain> Magnetomechanics.
- 2 In the Settings window for Magnetomechanics, locate the Lorentz Coupling section.
- 3 Select the Only use Lorentz force check box.
- 4 In the Model Builder window, click Magnetomechanics I (mmcpl1).
- 5 Locate the Domain Selection section. From the Selection list, choose Coil.

#### MESH I

In this model, the mesh is set up manually. Proceed by directly adding the desired mesh component.

The mesh used in computing the impedance needs to resolve the induced eddy currents in the pole piece and the top plate. For the results to be accurate, the skin depth needs to be resolved by at least 1, preferably 2 quadratic elements.

With a conductivity of 1.12e7 S/m and a peak relative permeability of 1200, the skin depth in the iron at the maximum frequency of 8 kHz does not go below 0.05 mm. In practice, most of the induced currents will run in regions of the pole piece where the biased relative permeability is much less than 1200, which makes the skin depth greater. In this model, it is therefore sufficient to use a mesh size of 0.5 mm along the iron surfaces that are closest to the voice coil.

For the acoustic-structure interaction, the air domain and the thin moving structures also need to be well resolved. In general, 5 to 6 second-order elements per wavelength are needed to resolve the waves. For more details, see Meshing (Resolving the Waves) in the Acoustics Module User's Guide. In this model, use 5 elements per wavelength in the acoustic domains. The PML is preferably meshed with mapped elements, use 8 elements for the default polynomial scaling.

# Mabbed I

- I In the Mesh toolbar, click Mapped.
- 2 In the Settings window for Mapped, locate the Domain Selection section.
- 3 From the Geometric entity level list, choose Domain.
- **4** Select Domains 1, 3, 5, 8–22, and 25 only.

#### Size

- I In the Model Builder window, click Size.
- 2 In the Settings window for Size, locate the Element Size section.
- **3** Click the **Custom** button.
- 4 Locate the Element Size Parameters section. In the Maximum element size text field, type lam0/5.
- 5 In the Minimum element size text field, type 0.5[mm].
- 6 In the Maximum element growth rate text field, type 1.15.

# Size 1

- I In the Model Builder window, right-click Mapped I and choose Size.
- **2** Select Domains 9, 13–16, and 20 only.
- 3 In the Settings window for Size, locate the Element Size section.
- 4 Click the **Custom** button.
- 5 Locate the Element Size Parameters section.
- **6** Select the **Maximum element size** check box. In the associated text field, type 2[mm].

# Size 2

- I Right-click Mapped I and choose Size.
- 2 In the Settings window for Size, locate the Geometric Entity Selection section.
- 3 Click Clear Selection.
- 4 Select Domains 3, 21, and 25 only.
- **5** Locate the **Element Size** section. Click the **Custom** button.
- 6 Locate the Element Size Parameters section.
- 7 Select the Maximum element size check box. In the associated text field, type 4[mm].

# Size 3

- I Right-click Mapped I and choose Size.
- 2 In the Settings window for Size, locate the Geometric Entity Selection section.

- 3 Click Clear Selection.
- **4** Select Domains 8, 10–12, 17–19, and 22 only.
- **5** Locate the **Element Size** section. Click the **Custom** button.
- 6 Locate the Element Size Parameters section.
- 7 Select the **Maximum element size** check box. In the associated text field, type 0.5[mm].

# Distribution I

- I Right-click Mapped I and choose Distribution.
- 2 Select Boundaries 22, 38, 41, and 45 only.
- 3 In the Settings window for Distribution, locate the Distribution section.
- 4 In the Number of elements text field, type 2.

#### Distribution 2

- I Right-click Mapped I and choose Distribution.
- **2** Select Boundaries 87 and 88 only.
- 3 In the Settings window for Distribution, locate the Distribution section.
- 4 In the Number of elements text field, type 8.
- 5 Click **Build Selected**.

# Free Triangular I

In the Mesh toolbar, click Free Triangular.

# Boundary Layers 1

- I In the Mesh toolbar, click Boundary Layers.
- 2 In the Settings window for Boundary Layers, locate the Domain Selection section.
- 3 From the Geometric entity level list, choose Domain.
- **4** Select Domains 4, 6, and 23 only.
- 5 Click to expand the Transition section. Clear the Smooth transition to interior mesh check box.

# Boundary Layer Properties

- I In the Model Builder window, click Boundary Layer Properties.
- 2 Select Boundaries 12, 53, and 95–98 only.

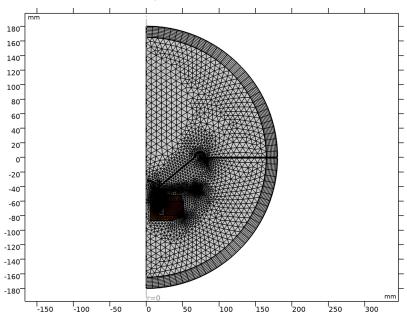

# Boundary Layer Properties I

- I In the Mesh toolbar, click Amore Attributes and choose Boundary Layer Properties.
- 2 Select Boundary 93 only.

- 3 In the Settings window for Boundary Layer Properties, locate the Layers section.
- 4 In the Number of layers text field, type 1.
- 5 Click **Build All**.

The image should look like this.

6 In the Model Builder window, click Mesh 1.

# STUDY I - MAGNETIC FIELDS

- I In the Model Builder window, click Study I.
- 2 In the Settings window for Study, type Study 1 Magnetic Fields in the Label text field.

Your Study node already contains the Stationary study that you picked from the Model Wizard. Disable the Pressure Acoustics and Solid Mechanics interfaces.

Add a Frequency-Domain, Perturbation study.

3 Locate the Study Settings section. Clear the Generate default plots check box.

# Step 1: Stationary

- I In the Model Builder window, under Study I Magnetic Fields click Step I: Stationary.
- 2 In the Settings window for Stationary, locate the Physics and Variables Selection section.

3 In the table, clear the Solve for check boxes for Pressure Acoustics, Frequency Domain (acpr) and Solid Mechanics (solid).

Step 2: Frequency-Domain Perturbation

- I In the Study toolbar, click Study Steps and choose Frequency Domain>Frequency-**Domain Perturbation.**
- 2 In the Settings window for Frequency-Domain Perturbation, locate the Study Settings section.
- **3** In the **Frequencies** text field, type 1 2 3 4 5 6 7 8 9.
- 4 Click Range.
- 5 In the Range dialog box, choose ISO preferred frequencies from the Entry method list.
- 6 In the Start frequency text field, type 10.
- 7 In the Stop frequency text field, type fmax.
- 8 From the Interval list, choose 1/12 octave.
- 9 Click Add.

This generates a few frequency points below 10 Hz and ISO preferred frequencies between 10 Hz and 8 kHz.

- 10 In the Settings window for Frequency-Domain Perturbation, locate the Physics and Variables Selection section.
- II In the table, clear the Solve for check boxes for Pressure Acoustics, Frequency Domain (acpr) and Solid Mechanics (solid).

NOTE: The first solution of this model is only of the electromagnetic part of the problem, with the coil assumed to be fixed in order to extract the BL factor and the blocked coil impedance. If you would like to skip ahead to the solution of the full electroacoustic problem, you can do so by proceeding from here to the instructions starting at the section Component I (compl), further below. Otherwise, continue by computing the solution.

12 In the Study toolbar, click **Compute**.

#### RESULTS

First, create a 2D plot to view the magnetic field distribution from the permanent magnet.

Static Magnetic Field

- I In the Home toolbar, click Add Plot Group and choose 2D Plot Group.
- 2 In the Settings window for 2D Plot Group, type Static Magnetic Field in the Label text field.

- **3** Locate the **Color Legend** section. Select the **Show units** check box.
- 4 Locate the Data section. From the Dataset list, choose Study I Magnetic Fields/
  Solution Store I (sol2).

Each step in a study creates its own dataset. The numbering of the datasets begins from the last step. Hence in this model Solution 2 contains the stationary solution and Solution 1 the frequency domain perturbation.

# Surface I

- I Right-click Static Magnetic Field and choose Surface.
- 2 In the Settings window for Surface, click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)>Magnetic Fields> Magnetic>mf.normH Magnetic field norm A/m.
- 3 Locate the Coloring and Style section. Click Change Color Table.
- 4 In the Color Table dialog box, select Thermal>Thermal in the tree.
- 5 Click OK.
- 6 In the Static Magnetic Field toolbar, click Plot.

You are now looking at the magnetic field norm created by the permanent magnet. Note that it has a distinct maximum in the gap where the voice coil is moving. If you zoom in a little, the plot should look like Figure 3.

Another interesting result is the effective relative permeability distribution in the iron. Begin by duplicating the existing plot.

# Static Magnetic Field

In the Model Builder window, right-click Static Magnetic Field and choose Duplicate.

# Effective Relative Permeability

- I In the Model Builder window, under Results click Static Magnetic Field I.
- 2 In the **Settings** window for **2D Plot Group**, type Effective Relative Permeability in the **Label** text field

#### Surface 1

- I In the Model Builder window, expand the Effective Relative Permeability node, then click Surface I.
- 2 In the Settings window for Surface, locate the Expression section.
- 3 In the Expression text field, type mf.normB/(mu0\_const\*mf.normH).
- **4** Select the **Description** check box. In the associated text field, type **Effective relative** permeability.

5 In the Effective Relative Permeability toolbar, click Plot.

This is the effective relative permeability at the linearization point, as given by the ratio of the flux density and the field multiplied by the permeability of vacuum. The plot should look like Figure 4.

Next, evaluate the BL force factor.

# Surface Average 1

- I In the Results toolbar, click 8.85 More Derived Values and choose Average> Surface Average.
- 2 In the Settings window for Surface Average, locate the Data section.
- 3 From the Dataset list, choose Study I Magnetic Fields/Solution Store I (sol2).
- **4** Locate the **Selection** section. From the **Selection** list, choose **Coil**.
- **5** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
-mf.Br*NO*2*pi*r	N/A	BL

- **6** Locate the **Integration Settings** section. Clear the **Compute volume integral** check box.
- 7 Click **= Evaluate**.

The BL factor evaluates to 10.5 N/A.

Next, study the induced current density at a few different frequencies.

#### Induced Current Density

- I In the Results toolbar, click 2D Plot Group.
- 2 In the Settings window for 2D Plot Group, type Induced Current Density in the Label text field.
- **3** Locate the **Color Legend** section. Select the **Show units** check box.

#### Surface 1

- I Right-click Induced Current Density and choose Surface.
- 2 In the Settings window for Surface, click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)>Magnetic Fields> Currents and charge>Conduction current density (spatial frame) - A/m2>mf.|iphi -Conduction current density, phi-component.

Note that the **Compute differential** check box, if turned on, wraps the expression in a lindev() operator. For more information, search for lindev in the COMSOL Multiphysics Documentation. The use of this check box is only necessary when plotting expressions that are not linear in the fields and that contain components of the linearization point (the DC solution). Examples of this type of expressions include electromagnetic force expressions.

- 3 Locate the Coloring and Style section. Click Change Color Table.
- 4 In the Color Table dialog box, select Rainbow>Prism in the tree.
- 5 Click OK.
- 6 In the Settings window for Surface, locate the Coloring and Style section.
- 7 From the Color table transformation list, choose Reverse.
- **8** In the **Induced Current Density** toolbar, click  **Plot**.

At 3500 Hz, the induced currents (or conduction currents) are highly localized to the surfaces of the top plate and pole piece.

## Induced Current Density

- I In the Model Builder window, click Induced Current Density.
- 2 In the Settings window for 2D Plot Group, locate the Data section.
- 3 From the Parameter value (freq (Hz)) list, choose 1.
- 4 In the Induced Current Density toolbar, click Plot.

At 10 Hz, the induced currents distribute throughout the material. The distribution depends on the vicinity to the voice coil, but also very much on the local effective permeability from the static study. To reproduce Figure 5, try two frequencies in between.

Before proceeding to the full electroacoustic analysis, plot the blocked coil inductance as a function of the frequency.

# Blocked Coil Inductance

- I In the Home toolbar, click Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Blocked Coil Inductance in the Label text field.
- 3 Click to expand the **Title** section. From the **Title type** list, choose **Label**.

### Global I

- I Right-click Blocked Coil Inductance and choose Global.
- 2 In the Settings window for Global, locate the y-Axis Data section.

**3** In the table, enter the following settings:

Expression	Unit	Description
mf.LCoil_1	mH	Coil inductance

- 4 Click the x-Axis Log Scale button in the Graphics toolbar.
- 5 In the Blocked Coil Inductance toolbar, click Plot.

The result should look like Figure 6.

Having extracted the force factor and the voice coil inductance, you now have most of the electromagnetic data required for a separate model of the acoustic parts of a boxed loudspeaker driver. See the Loudspeaker Driver in a Vented Enclosure model also in the Application Library. What remains is the real part of the blocked coil impedance. This is available as mf.RCoil\_1, the Coil Resistance. If you would like to extract this too, you can set it up in a Global plot just like the inductance, and export the results as described in the following steps.

#### Plot I

I Right-click Global I and choose Add Plot Data to Export.

If you want to export the data, you can now enter a filename and click the **Export** button.

# COMPONENT I (COMPI)

It is now time to compute and evaluate the solution of the entire model, including the acoustic-structure interaction. In order to this, you will set up a new study. Although you could technically reuse the static magnetic fields solution from the first study, it can be handy to include this step in the new study too. This allows you to make changes anywhere in the model, including such that affect the static magnetic fields, and run only the new study again to get correctly updated results.

### ADD STUDY

- I In the Home toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.

Select an empty study so that you can copy and modify the study steps from your previous study.

- 3 Find the Studies subsection. In the Select Study tree, select Empty Study.
- 4 Click Add Study in the window toolbar.
- 5 In the Home toolbar, click Add Study to close the Add Study window.

### STUDY I - MAGNETIC FIELDS

Step 1: Stationary, Step 2: Frequency-Domain Perturbation

- I In the Model Builder window, under Study I Magnetic Fields, Ctrl-click to select Step 1: Stationary and Step 2: Frequency-Domain Perturbation.
- 2 Right-click and choose Copy.

### STUDY 2 - COMPLETE MODEL

- I In the Model Builder window, right-click Study 2 and choose Paste Multiple Items.
- 2 In the Model Builder window, click Study 2.
- 3 In the Settings window for Study, type Study 2 Complete Model in the Label text field.
- 4 Locate the Study Settings section. Clear the Generate default plots check box.

## Step 2: Frequency-Domain Perturbation

Make the Frequency Domain, Perturbed study solve for the acoustics and the solid physics too.

- I In the Model Builder window, under Study 2 Complete Model click Step 2: Frequency-Domain Perturbation.
- 2 In the Settings window for Frequency-Domain Perturbation, locate the Physics and Variables Selection section.
- 3 In the table, select the Solve for check boxes for Pressure Acoustics, Frequency Domain (acpr) and Solid Mechanics (solid).
- 4 In the Home toolbar, click **Compute**.

### RESULTS

You will now have received two more datasets: Solution 4 containing the same static magnetic fields as Solution 2, and Solution 3 with the frequency domain electromagnetic and acoustic-structure interaction results. In order to get a good overview of the latter, begin by adding a selection of all domains except the PMLs.

#### Selection

- I In the Model Builder window, expand the Results>Datasets node.
- 2 Right-click Study 2 Complete Model/Solution 3 (sol3) and choose Selection.
- 3 In the Settings window for Selection, locate the Geometric Entity Selection section.
- 4 From the Geometric entity level list, choose Domain.
- 5 From the Selection list, choose All Domains Without the PML.

Create a 3D plot of the instantaneous pressure distribution at zero phase in and around the speaker.

### ADD PREDEFINED PLOT

- Add Predefined Plot to open the Add Predefined Plot I In the **Home** toolbar, click window.
- 2 Go to the Add Predefined Plot window.

### RESULTS

- I In the tree, select Study 2 Complete Model/Solution 3 (sol3)>Pressure Acoustics, Frequency Domain>Acoustic Pressure, 3D (acpr).
- 2 Click Add Plot in the window toolbar.
- 3 From the Home menu, choose Add Predefined Plot.

### Contour I

- I In the Model Builder window, expand the Results>Datasets node.
- 2 Right-click Acoustic Pressure, 3D (acpr) and choose Contour.
- 3 In the Settings window for Contour, locate the Expression section.
- 4 In the Expression text field, type acpr.p t.
- 5 Locate the Coloring and Style section. From the Coloring list, choose Uniform.
- 6 From the Color list, choose Gray.
- 7 Clear the Color legend check box.

Next, reproduce Figure 7 with a plot of the local sound pressure level.

### ADD PREDEFINED PLOT

- I In the Home toolbar, click Add Predefined Plot to open the Add Predefined Plot window.
- 2 Go to the Add Predefined Plot window.
- 3 In the tree, select Study 2 Complete Model/Solution 3 (sol3)>Pressure Acoustics, Frequency Domain>Sound Pressure Level, 3D (acpr).
- 4 Click Add Plot in the window toolbar.
- 5 In the Home toolbar, click Add Predefined Plot to close the Add Predefined Plot window.
- 6 Click the | Show Grid button in the Graphics toolbar.

### RESULTS

Sound Pressure Level, 3D (acpr)

- I In the Model Builder window, click Contour I.
- 2 In the Sound Pressure Level, 3D (acpr) toolbar, click Plot.

The result should look like Figure 7.

Create a 1D plot of the sensitivity versus the frequency, as in Figure 8.

## Sensitivity

- I In the Home toolbar, click Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Sensitivity in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 2 Complete Model/ Solution 3 (sol3).
- 4 Locate the Title section. From the Title type list, choose Label.
- 5 Locate the **Plot Settings** section.
- **6** Select the **x-axis label** check box. In the associated text field, type Frequency (Hz).
- 7 Select the y-axis label check box. In the associated text field, type SPL (dB).
- 8 Locate the Legend section. From the Position list, choose Lower middle.

## Octave Band I

- I In the Sensitivity toolbar, click \to More Plots and choose Octave Band.
- 2 In the Settings window for Octave Band, locate the Selection section.
- 3 From the Geometric entity level list, choose Global.

Use the Octave Band Plot to depict the sensitivity. Evaluate the pressure 1 m in front using pext() operator. The reference pressure is the default for an SPL evaluation. Plot the sensitivity both as a continuous curve and in 1/3 octave bands.

- 4 Locate the y-Axis Data section. In the Expression text field, type pext(0,1[m]).
- 5 In the Sensitivity toolbar, click Plot.
- 6 Locate the Plot section. From the Quantity list, choose Band average power spectral density.
- 7 From the Band type list, choose 1/3 octave.
- 8 Click to expand the Coloring and Style section. From the Type list, choose Outline.
- 9 Right-click Octave Band I and choose Duplicate.

### Octave Band 2

I In the Model Builder window, click Octave Band 2.

- 2 In the Settings window for Octave Band, locate the Plot section.
- 3 From the Quantity list, choose Continuous power spectral density.
- **4** In the **Sensitivity** toolbar, click **M Plot**.
- 5 Locate the Coloring and Style section. From the Width list, choose 2.
- **6** Click to expand the **Legends** section. Select the **Show legends** check box.
- 7 From the Legends list, choose Manual.
- **8** In the table, enter the following settings:

Legends	
Complete	Study

# Sensitivity

- I In the Model Builder window, click Sensitivity.
- 2 In the Settings window for ID Plot Group, locate the Axis section.
- 3 Select the Manual axis limits check box.
- 4 In the x minimum text field, type 15.
- **5** In the **y minimum** text field, type 64.
- 6 In the y maximum text field, type 92.
- 7 Locate the Legend section. From the Position list, choose Lower right.
- 8 In the Sensitivity toolbar, click Plot. Finally, plot the total electric impedance versus the frequency.

# Total Electric Impedance

- I In the Home toolbar, click Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Total Electric Impedance in the **Label** text field.
- 3 Locate the Data section. From the Dataset list, choose Study 2 Complete Model/ Solution 3 (sol3).
- 4 Locate the **Title** section. From the **Title type** list, choose **Label**.
- 5 Locate the **Plot Settings** section.
- 6 Select the x-axis label check box. In the associated text field, type Frequency (Hz).
- 7 Select the y-axis label check box. In the associated text field, type Z (\Omega).

### Global I

I Right-click Total Electric Impedance and choose Global.

A predefined variable exists of the coil impedance mf.ZCoil 1. It is defined as the driving voltage divided by the time-harmonic current through the coil. The results are depicted in Figure 10.

- 2 In the Settings window for Global, locate the y-Axis Data section.
- **3** In the table, enter the following settings:

Expression	Unit	Description	
abs(mf.ZCoil_1)		abs(Z)	
real(mf.ZCoil_1)		real(Z)	
imag(mf.ZCoil_1)		imag(Z)	

- **5** Click the **x-Axis Log Scale** button in the **Graphics** toolbar.

Next create a plot of the deformation of the loudspeaker showing the displacement. This can in general be used to visualize breakups in the cone and surround.

# Displacement

- I In the Home toolbar, click Add Plot Group and choose 3D Plot Group.
- 2 In the Settings window for 3D Plot Group, type Displacement in the Label text field.
- **3** Locate the **Color Legend** section. Select the **Show units** check box.

### Surface 1

- I Right-click Displacement and choose Surface.
- 2 In the Settings window for Surface, locate the Expression section.
- 3 In the Expression text field, type solid.disp.

### Deformation I

- I Right-click Surface I and choose Deformation.
- 2 In the Displacement toolbar, click Plot.

The plot should look like the one in Figure 10.

Now, visualize the directivity of the loudspeaker using the built-in **Directivity** plot. This is an important plot used to visualize and analyze the spatial response of the speaker as function of the frequency.

## Directivity Plot

I In the Home toolbar, click <a>I</a> Add Plot Group and choose ID Plot Group.

- 2 In the Settings window for ID Plot Group, type Directivity Plot in the Label text
- 3 Locate the Data section. From the Dataset list, choose Study 2 Complete Model/ Solution 3 (sol3).
- 4 Locate the Title section. From the Title type list, choose Label.

# Directivity I

I In the Directivity Plot toolbar, click \to More Plots and choose Directivity.

Per default the reference direction is along the z-axis. This defines what 0 deg corresponds to. Change the angles to correspond to everything in front of the speaker, that is, from -90 to 90 deg.

- 2 In the Settings window for Directivity, locate the Evaluation section.
- 3 Find the Angles subsection. From the Restriction list, choose Manual.
- 4 In the Number of angles text field, type 360.
- 5 In the  $\phi$  start text field, type -90.
- 6 In the  $\phi$  range text field, type 180.
- 7 Find the Evaluation distance subsection. In the Radius text field, type 1[m].
- 8 Locate the Levels section. From the Entry method list, choose Levels.
- **9** In the **Levels** text field, type -15 -12 -9 -6 -3 -2 -1 1 2 3.
- **10** In the **Directivity Plot** toolbar, click **10 Plot**.

The horizontal scale can also be represented using a logarithmic scale by selecting **x-Axis** Log Scale in the Graphics window.

The image should look like the one in Figure 12. If you are more familiar with having the frequency on the y-axis, you can just change that under the Coloring and Style tab and change the Layout option.

# Coil Power and Efficiency

- I In the Home toolbar, click Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Coil Power and Efficiency in the Label text field.
- 3 Locate the Title section. From the Title type list, choose Label.
- 4 Locate the Data section. From the Dataset list, choose Study 2 Complete Model/ Solution 3 (sol3).
- **5** Locate the **Plot Settings** section. Select the **Two y-axes** check box.
- 6 Locate the Legend section. From the Position list, choose Middle left.

# Global I

- I Right-click Coil Power and Efficiency and choose Global.
- 2 In the Settings window for Global, locate the y-Axis Data section.
- **3** In the table, enter the following settings:

Expression	Unit	Description
coil_power	W	Coil power

# Global 2

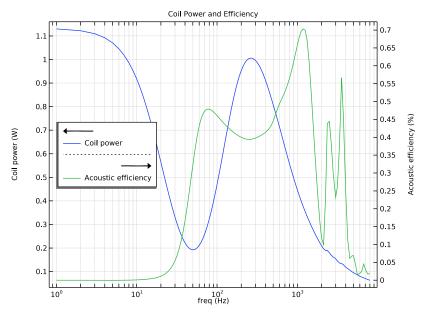

- I In the Model Builder window, right-click Coil Power and Efficiency and choose Global.
- 2 In the Settings window for Global, locate the y-Axis section.
- 3 Select the Plot on secondary y-axis check box.
- **4** Locate the **y-Axis Data** section. In the table, enter the following settings:

Expression	Unit	Description
aco_eff	%	Acoustic efficiency

5 Click the x-Axis Log Scale button in the Graphics toolbar.

6 In the Coil Power and Efficiency toolbar, click Plot.

The plot should look like this.

In the following steps, create a new study where the Narrow Region Acoustics features are disabled. This will highlight how the thermoviscous losses have a large influence around the back cavity modes but negligible influence on the global response of the loudspeaker for the rest of the frequencies.

### ADD STUDY

- I In the Home toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select Empty Study.
- 4 Click Add Study in the window toolbar.
- 5 In the Home toolbar, click Add Study to close the Add Study window.

# STUDY 2 - COMPLETE MODEL

# Step 1: Stationary

In the Model Builder window, under Study 2 - Complete Model right-click Step 1: Stationary and choose Copy.

### STUDY 3

In the Model Builder window, right-click Study 3 and choose Paste Stationary.

### STUDY 2 - COMPLETE MODEL

Step 2: Frequency-Domain Perturbation

In the Model Builder window, under Study 2 - Complete Model right-click Step 2: Frequency-**Domain Perturbation** and choose **Copy**.

### STUDY 3 - COMPLETE MODEL, WITHOUT NARROW REGION ACOUSTICS

In the Model Builder window, right-click Study 3 and choose Paste Frequency-**Domain Perturbation.** 

- I In the Model Builder window, under Study 3 click Step 2: Frequency-Domain Perturbation.
- 2 In the Settings window for Frequency-Domain Perturbation, locate the Physics and Variables Selection section.
- 3 Select the Modify model configuration for study step check box.
- 4 In the tree, select Component I (compl)>Pressure Acoustics, Frequency Domain (acpr)> Narrow Region Acoustics 1.
- 5 Click **Disable**.
- 6 In the tree, select Component I (compl)>Pressure Acoustics, Frequency Domain (acpr)> Narrow Region Acoustics 2.
- 7 Click O Disable.
- 8 In the Model Builder window, click Study 3.
- 9 In the Settings window for Study, type Study 3 Complete Model, Without Narrow Region Acoustics in the Label text field.
- **10** Locate the **Study Settings** section. Clear the **Generate default plots** check box.
- II In the **Home** toolbar, click **Compute**.

### RESULTS

### Octave Band 2

- I In the Model Builder window, under Results>Sensitivity click Octave Band 2.
- 2 In the Settings window for Octave Band, locate the Data section.
- 3 From the Dataset list, choose Study 3 Complete Model, Without Narrow Region Acoustics/Solution 5 (sol5).

**4** Locate the **Legends** section. In the table, enter the following settings:

Legends Complete Study - Without Narrow Region Acoustics

- 5 Locate the Coloring and Style section. Find the Line style subsection. From the Line list, choose **Dotted**.
- 6 Right-click Results>Sensitivity>Octave Band 2 and choose Duplicate.

# Octave Band 3

- I In the Model Builder window, click Octave Band 3.
- 2 In the Settings window for Octave Band, locate the Data section.
- 3 From the Dataset list, choose From parent.
- **4** Locate the **Legends** section. In the table, enter the following settings:

# Legends Complete Study

- 5 Locate the Coloring and Style section. Find the Line style subsection. From the Line list, choose Solid.
- 6 In the Sensitivity toolbar, click Plot.

The image should look like the one in Figure 8. As you can see, the two models only differ for the frequencies around 600 Hz and 1300 Hz, which indicate back cavity modes.

Proceed and create a mirror dataset. It will be used to visually compare the frequency distribution in the driver at different frequencies, by having them side by side.

### Mirror 2D I

- I In the Results toolbar, click More Datasets and choose Mirror 2D.
- 2 In the Settings window for Mirror 2D, locate the Data section.
- 3 From the Dataset list, choose Study 3 Complete Model, Without Narrow Region Acoustics/Solution 5 (sol5).

Acoustic Pressure - Without Narrow Region Acoustics

- 2 In the Settings window for 2D Plot Group, type Acoustic Pressure Without Narrow Region Acoustics in the Label text field.
- **3** Locate the **Color Legend** section. Select the **Show units** check box.

- 4 Locate the Data section. From the Dataset list, choose Mirror 2D 1.
- 5 From the Parameter value (freq (Hz)) list, choose 600.

## Surface I

- I Right-click Acoustic Pressure Without Narrow Region Acoustics and choose Surface.
- 2 In the Settings window for Surface, locate the Expression section.
- 3 In the Expression text field, type acpr.p t.
- 4 Locate the Coloring and Style section. From the Scale list, choose Linear symmetric.
- 5 Click Change Color Table.
- 6 In the Color Table dialog box, select Wave>Wave in the tree.
- 7 Click OK.
- 8 In the Acoustic Pressure Without Narrow Region Acoustics toolbar, click Plot.
- **9** Right-click **Surface I** and choose **Duplicate**.

# Surface 2

- I In the Model Builder window, click Surface 2.
- 2 In the Settings window for Surface, locate the Data section.
- 3 From the Dataset list, choose Study 3 Complete Model, Without Narrow Region Acoustics/Solution 5 (sol5).
- 4 From the Parameter value (freq (Hz)) list, choose 630.
- 5 Click to expand the **Title** section. From the **Title type** list, choose **None**.
- 6 Click to expand the Inherit Style section. From the Plot list, choose Surface 1.

### Annotation I

- I In the Model Builder window, right-click Acoustic Pressure -Without Narrow Region Acoustics and choose Annotation.
- 2 In the Settings window for Annotation, locate the Annotation section.
- 3 In the **Text** text field, type Pressure at 630 Hz.
- 4 Locate the **Position** section. In the x text field, type 10[mm].
- 5 In the y text field, type 20[mm].
- 6 Locate the Coloring and Style section. Clear the Show point check box.
- 7 Right-click Annotation I and choose Duplicate.

### Annotation 2

I In the Model Builder window, click Annotation 2.

- 2 In the Settings window for Annotation, locate the Position section.
- 3 In the x text field, type -140[mm].
- 4 Locate the Annotation section. In the Text text field, type Pressure at 600 Hz.

### Line 1

- I In the Model Builder window, right-click Acoustic Pressure -Without Narrow Region Acoustics and choose Line.
- 2 In the Settings window for Line, locate the Expression section.
- **3** In the **Expression** text field, type **0**.
- 4 Locate the Data section. From the Dataset list, choose Mirror 2D 1.
- 5 Click to expand the **Title** section. From the **Title type** list, choose **None**.
- 6 Locate the Coloring and Style section. From the Coloring list, choose Uniform.
- 7 From the Color list, choose Black.
- 8 Click the **Zoom Extents** button in the **Graphics** toolbar.
- 9 In the Acoustic Pressure Without Narrow Region Acoustics toolbar, click Plot. The result should look like Figure 9.

Now, proceed to set up an eigenfrequency analysis for the structural part of the loudspeaker driver.

# ADD STUDY

- I In the Home toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- **3** Find the **Physics interfaces in study** subsection. In the table, clear the **Solve** check boxes for Magnetic Fields (mf) and Pressure Acoustics, Frequency Domain (acpr).
- 4 Find the Multiphysics couplings in study subsection. In the table, clear the Solve check boxes for Acoustic-Structure Boundary I (asbI) and Magnetomechanics I (mmcpII).
- 5 Find the Studies subsection. In the Select Study tree, select General Studies> Eigenfrequency.
- 6 Click Add Study in the window toolbar.
- 7 In the Home toolbar, click Add Study to close the Add Study window.

### STUDY 4 - EIGENFREOUENCY

- I In the Model Builder window, click Study 4.
- 2 In the Settings window for Study, type Study 4 Eigenfrequency in the Label text field.

# Step 1: Eigenfrequency

- I In the Model Builder window, under Study 4 Eigenfrequency click Step 1: Eigenfrequency.
- 2 In the Settings window for Eigenfrequency, locate the Study Settings section.
- **3** Select the **Desired number of eigenfrequencies** check box. In the associated text field, type 10.
- 4 From the Search method around shift list, choose Larger real part.
- 5 In the **Home** toolbar, click **Compute**.

### RESULTS

## Selection

- I In the Model Builder window, right-click Study 4 Eigenfrequency/Solution 7 (sol7) and choose Selection.
- 2 In the Settings window for Selection, locate the Geometric Entity Selection section.
- 3 From the Geometric entity level list, choose Domain.
- 4 From the Selection list, choose Structural Domains.

Mode Shape, 3D (solid)

By looping through the different modes, you can reproduce the plot in Figure 11 and identify the modes that limit the frequency range of the speaker. Note that this analysis is limited to the axisymmetric modes.

I In the Model Builder window, under Results click Mode Shape, 3D (solid).

Eigenfrequency=53.237+12.696i Hz Surface: Displacement magnitude

y. Z x

# Appendix: Geometry Sequence Instructions

From the File menu, choose New.

### NEW

In the New window, click Blank Model.

### ADD COMPONENT

In the Home toolbar, click Add Component and choose 2D Axisymmetric.

### GEOMETRY I

- I In the Settings window for Geometry, locate the Units section.
- 2 From the Length unit list, choose mm.

Circle I (c1)

- I In the Geometry toolbar, click ( Circle.
- 2 In the Settings window for Circle, locate the Size and Shape section.
- 3 In the Radius text field, type 180[mm].
- 4 Click to expand the **Layers** section. In the table, enter the following settings:

Layer name	Thickness (mm)
Layer 1	15[mm]

Circle 2 (c2)

- I In the **Geometry** toolbar, click Circle.
- 2 In the Settings window for Circle, locate the Size and Shape section.
- 3 In the Radius text field, type 8[mm].
- 4 In the Sector angle text field, type 180.
- **5** Locate the **Position** section. In the **r** text field, type 74[mm].
- **6** Locate the **Layers** section. In the table, enter the following settings:

Layer name	Thickness (mm)
Layer 1	1.5[mm]

Delete Entities I (del1)

- I In the Model Builder window, right-click Geometry I and choose Delete Entities.
- 2 On the object c2, select Boundaries 2–4 only.

Rectangle I (rI)

- I In the Geometry toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- 3 In the Width text field, type 120[mm].

- 4 In the **Height** text field, type 1[mm].
- **5** Locate the **Position** section. In the **r** text field, type 80.5[mm].
- 6 In the z text field, type -1 [mm].

# Difference I (dif1)

- I In the Geometry toolbar, click Booleans and Partitions and choose Difference.
- 2 Select the object cl only.
- 3 In the Settings window for Difference, locate the Difference section.
- 4 Click to select the Activate Selection toggle button for Objects to subtract.
- **5** Select the object **r1** only.

# Rectangle 2 (r2)

- I In the Geometry toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- 3 In the Width text field, type 42[mm].
- 4 In the Height text field, type 35[mm].
- **5** Locate the **Position** section. In the **r** text field, type 6[mm].
- 6 In the z text field, type -87[mm].

## Rectangle 3 (r3)

- I In the Geometry toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- 3 In the Width text field, type 35.5[mm].
- 4 In the Height text field, type 20[mm].
- 5 Locate the **Position** section. In the r text field, type 15.5[mm].
- 6 In the z text field, type -80[mm].

# Rectangle 4 (r4)

- I In the Geometry toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- **3** In the **Width** text field, type 1.2[mm].
- 4 In the **Height** text field, type 8[mm].
- **5** Locate the **Position** section. In the **r** text field, type 17.8[mm].
- 6 In the z text field, type -60[mm].

# Rectangle 5 (r5)

- I In the Geometry toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- 3 In the Width text field, type 26[mm].
- 4 In the Height text field, type 20[mm].
- **5** Locate the **Position** section. In the **r** text field, type 25[mm].
- 6 In the z text field, type -80[mm].

# Polygon I (boll)

- I In the Geometry toolbar, click / Polygon.
- 2 In the Settings window for Polygon, locate the Coordinates section.
- 3 From the Data source list, choose Vectors.
- 4 In the r text field, type 48[mm] 36[mm] 36[mm] 48[mm].
- 5 In the z text field, type -82[mm] -87[mm] -87[mm] -87[mm].

# Difference 2 (dif2)

- I In the Geometry toolbar, click Booleans and Partitions and choose Difference.
- 2 Select the object r2 only.
- 3 In the Settings window for Difference, locate the Difference section.
- 4 Click to select the **Activate Selection** toggle button for **Objects to subtract**.
- 5 Select the objects poll, r3, and r4 only.

## Rectangle 6 (r6)

- I In the **Geometry** toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- 3 In the Width text field, type 0.2[mm].
- 4 In the Height text field, type 25[mm].
- 5 Locate the **Position** section. In the r text field, type 18.2[mm].
- 6 In the z text field, type -64[mm].
- 7 Click to expand the **Layers** section. In the table, enter the following settings:

Layer name	Thickness (mm)
Layer 1	1.26[mm]
Layer 2	3.84[mm]
Layer 3	0.4[mm]

- 8 Clear the Layers on bottom check box.
- 9 Select the Layers on top check box.

## Rectangle 7 (r7)

- I In the Geometry toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- **3** In the **Width** text field, type **0.6**[mm].
- 4 In the Height text field, type 9.4[mm].
- 5 Locate the **Position** section. In the r text field, type 18.2[mm].
- 6 In the z text field, type -60.7[mm].

# Polygon 2 (pol2)

- I In the Geometry toolbar, click / Polygon.
- 2 In the Settings window for Polygon, locate the Coordinates section.
- 3 From the Data source list, choose Vectors.
- 4 In the r text field, type 18.4 [mm] 23[mm] 26[mm] 26[mm] 32[mm] 32[mm] 38[mm] 38[mm] 44[mm] 50[mm] 50[mm] 56[mm] 56[mm] 59[mm] 66[mm] 66[mm] 59[mm] 56[mm] 56[mm] 50[mm] 50[mm] 44[mm] 44[mm] 38[mm] 38[mm] 32[mm] 32[mm] 26[mm] 26[mm] 23[mm] 18.4 [mm].
- 5 In the z text field, type -44.1[mm] -44.1[mm] -42.1[mm] -42.1[mm] -46.1[mm] -46.1[mm] -46.1[mm] -46.1[mm] -42.1[mm] -42.1[mm] -46.1[mm] -46.1[mm] -46.5[mm] -46.5[mm] -46.5[mm] -46.5[mm] -42.5[mm] -44.5[mm] -44.5[mm

# Polygon 3 (pol3)

- I In the Geometry toolbar, click / Polygon.
- 2 In the Settings window for Polygon, locate the Coordinates section.
- 3 From the Data source list, choose Vectors.
- 4 In the r text field, type 18.4[mm] 66[mm] 66[mm] 67.5[mm] 67.5[mm] 18.4[mm] 18.4[mm].
- 5 In the z text field, type -39[mm] 0 0 0 0 -40.26[mm] -40.26[mm] -39[mm].

### Quadratic Bézier I (qb1)

- I In the Geometry toolbar, click \* More Primitives and choose Quadratic Bézier.
- 2 In the Settings window for Quadratic Bézier, locate the Control Points section.

- 3 In row 1, set r to -18.2[mm].
- 4 In row 3, set r to 18.2[mm].
- 5 In row 1, set z to -39[mm].
- 6 In row 2, set z to -23.5[mm].
- 7 In row 3, set z to -39[mm].
- 8 Locate the Weights section. In the 2 text field, type 1.

# Line Segment I (Is I)

- I In the Geometry toolbar, click : More Primitives and choose Line Segment.
- 2 In the Settings window for Line Segment, locate the Starting Point section.
- **3** From the **Specify** list, choose **Coordinates**.
- **4** Locate the **Endpoint** section. From the **Specify** list, choose **Coordinates**.
- 5 Locate the Starting Point section. In the r text field, type 18.2[mm].
- 6 Locate the **Endpoint** section. In the r text field, type 18.2[mm].
- 7 Locate the Starting Point section. In the z text field, type -39[mm].
- **8** Locate the **Endpoint** section. In the **z** text field, type -40.26[mm].

# Ouadratic Bézier 2 (ab2)

- I In the Geometry toolbar, click \* More Primitives and choose Quadratic Bézier.
- 2 In the Settings window for Quadratic Bézier, locate the Control Points section.
- 3 In row 1, set r to 18.2[mm].
- 4 In row 3, set r to -18.2[mm].
- 5 In row 1, set z to -40.26[mm].
- 6 In row 2, set z to -24.26[mm].
- 7 In row 3, set z to -40.26[mm].
- **8** Locate the **Weights** section. In the **2** text field, type 1.

# Line Segment 2 (Is2)

- I In the Geometry toolbar, click \* More Primitives and choose Line Segment.
- 2 In the Settings window for Line Segment, locate the Starting Point section.
- 3 From the Specify list, choose Coordinates.
- 4 Locate the **Endpoint** section. From the **Specify** list, choose **Coordinates**.
- 5 Locate the Starting Point section. In the r text field, type -18.2[mm].
- 6 Locate the **Endpoint** section. In the r text field, type -18.2[mm].

- 7 Locate the Starting Point section. In the z text field, type -40.26[mm].
- 8 Locate the **Endpoint** section. In the **z** text field, type -39[mm].

## Fillet I (fill)

- I In the Geometry toolbar, click Fillet.
- 2 On the object dif2, select Points 5–8 only.
- 3 In the Settings window for Fillet, locate the Radius section.
- 4 In the Radius text field, type 0.2[mm].

# Rectangle 8 (r8)

- I In the Geometry toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- 3 In the Width text field, type 1.2 [mm].
- 4 In the **Height** text field, type 7.6[mm].
- **5** Locate the **Position** section. In the **r** text field, type 17.8[mm].
- 6 In the z text field, type -59.8[mm].
- 7 In the Geometry toolbar, click **Build All**.
