

Heat Generation in a Vibrating Structure

When a structure is subjected to vibrations of high frequency, a significant amount of heat can be generated within the structure because of mechanical losses in the material such as, for example, viscoelastic effects.

In this example, you model the slow rise of the temperature in a vibrating beam-like structure. You use a transient heat-transfer problem with source term which represents the heat generation due to mechanical losses. The simulation is based on a structural analysis performed in the frequency domain.

Model Definition

The beam consists of two layers made of aluminum and titanium, respectively, with the corresponding loss factors 0.001 and 0.005. One end of the beam is fixed, and the other one is subjected to periodic loading in the z direction, which is represented in the frequency domain as $F_z \exp(j\omega t)$, where j is the imaginary unit, and the angular frequency is

$$\omega = 2\pi f$$

The excitation frequency f = 7767 Hz and the load magnitude F_z = 1.7 MPa are used in this example.

The temperature rise is given by the heat-transfer equation

$$\rho C_p \frac{\partial T}{\partial t} - \nabla \cdot (k \nabla T) \, = \, Q_h$$

where k is the thermal conductivity, and the volumetric heat capacity ρC_p is independent of the temperature in accordance with the Dulong-Petit law.

Note that T represents the temperature averaged over the time period $2\pi/\omega$. The heat source

$$Q_h = \frac{1}{2} \omega \eta \text{Real}[\varepsilon : \text{Conj}(\mathsf{C} : \varepsilon)]$$

presents the internal work of the nonelastic (for example, viscous) forces over the period. In the above expression, η is the loss factor, ε is the strain tensor, and C is the elasticity tensor. The term is computed from a structural analysis performed in the frequency domain.

The initial state at time t = 0 is stress-free, and the initial temperature is 293.15 K over the entire beam.

Use the following boundary conditions:

- At the fixed end, use the temperature condition T = 293.15 K.
- At the end subjected to periodic force, use the thermal insulation condition.
- The boundary between the layers of different materials is an interior boundary.
- At all other boundaries, use the convective cooling condition:

$$\mathbf{n} \cdot (-k \nabla T) = h(T - T_{\text{ext}})$$

where $h = 5 \text{ W/(m}^2 \cdot \text{K})$ is the heat transfer coefficient and $T_{\text{ext}} = 293.15 \text{ K}$ is the external temperature.

For the simulation, apply a periodic loading in the z direction of magnitude 1.7 MPa and frequency 7767 Hz at the free end of the beam for 2 seconds, keeping the fixed end and the structure environment at a constant temperature of 300 K during the process.

Results and Discussion

The stress solution computed in frequency domain is shown in Figure 1. It appears that the maximum stresses are located at the fixed end. As consequence more energy is dissipated at this location.

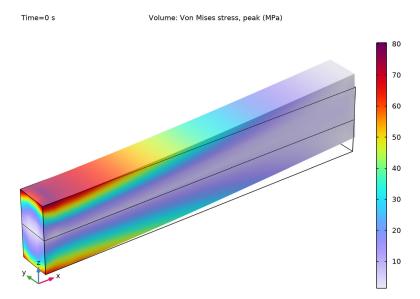

Figure 1: von Mises stress from the frequency domain solution.

Figure 2 displays the temperature distribution at the end of the simulated 2-second forced vibrations. As the figure shows, the maximum temperature rise in the beam is about 0.18 K.

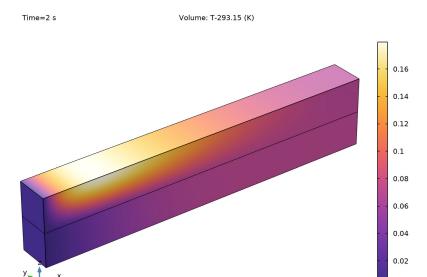

Figure 2: Temperature increase in the beam after 2 seconds of forced vibrations.

The maximum temperature increase is plotted in Figure 3, it shows that the maximum temperature increases in the first time steps, then starts to stabilize around the end time.

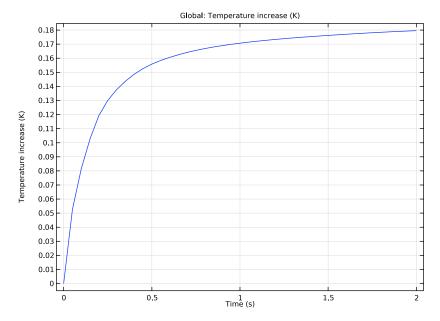

Figure 3: Maximum temperature increase with time.

Modeling Instructions

From the File menu, choose New.

NEW

In the New window, click Model Wizard.

MODEL WIZARD

- I In the Model Wizard window, click **1** 3D.
- 2 In the Select Physics tree, select Heat Transfer>Heat Transfer in Solids (ht).
- 3 Click Add.

- 4 In the Select Physics tree, select Structural Mechanics>Solid Mechanics (solid).
- 5 Click Add.
- 6 Click 🗪 Study.
- 7 In the Select Study tree, select General Studies>Time Dependent.
- 8 Click M Done.

GEOMETRY I

Block I (blk I)

- I In the Geometry toolbar, click Block.
- 2 In the Settings window for Block, locate the Size and Shape section.
- 3 In the Width text field, type 0.01.
- 4 In the **Depth** text field, type 0.001.
- 5 In the Height text field, type 0.001.

Block 2 (blk2)

- I In the Geometry toolbar, click **Block**.
- 2 In the Settings window for Block, locate the Size and Shape section.
- 3 In the Width text field, type 0.01.
- 4 In the Depth text field, type 0.001.
- **5** In the **Height** text field, type **0.001**.
- 6 Locate the **Position** section. In the **z** text field, type 0.001.
- 7 In the Model Builder window, right-click Geometry I and choose Build All Objects.

ADD MATERIAL

- I In the Home toolbar, click Radd Material to open the Add Material window.
- 2 Go to the Add Material window.
- 3 In the tree, select Built-in>Aluminum.
- 4 Click Add to Component in the window toolbar.
- 5 In the tree, select Built-in>Titanium beta-21S.
- **6** Click **Add to Component** in the window toolbar.
- 7 In the Home toolbar, click 🙀 Add Material to close the Add Material window.

MATERIALS

Aluminum (mat I)

- I In the Model Builder window, under Component I (compl)>Materials click Aluminum (mat I).
- 2 Select Domain 1 only.

Titanium beta-21S (mat2)

- I In the Model Builder window, click Titanium beta-215 (mat2).
- **2** Select Domain 2 only.

SOLID MECHANICS (SOLID)

You need to set up the Solid Mechanics equation form to frequency-domain, since the study type will be set to time dependent. The time dependent equations should be applied to the heat transfer physics only.

- I In the Model Builder window, under Component I (compl) click Solid Mechanics (solid).
- 2 In the Settings window for Solid Mechanics, click to expand the Equation section.
- 3 From the Equation form list, choose Frequency domain.
- **4** From the **Frequency** list, choose **User defined**. In the f text field, type 7767.

Fixed Constraint 1

- I In the Physics toolbar, click **Boundaries** and choose **Fixed Constraint**.
- 2 Select Boundaries 1 and 4 only.

Boundary Load 1

- I In the Physics toolbar, click **Boundaries** and choose **Boundary Load**.
- 2 Select Boundaries 10 and 11 only.
- 3 In the Settings window for Boundary Load, locate the Force section.
- **4** Specify the \mathbf{F}_{A} vector as

0	x
0	у
1.7[MPa]	z

Linear Elastic Material I

In the Model Builder window, click Linear Elastic Material 1.

Dambing I

- I In the Physics toolbar, click 🕞 Attributes and choose Damping.
- 2 Select Domain 1 only.
- 3 In the Settings window for Damping, locate the Damping Settings section.
- 4 From the Damping type list, choose Isotropic loss factor.
- **5** From the η_s list, choose **User defined**. In the associated text field, type 0.001.

Linear Elastic Material I

In the Model Builder window, click Linear Elastic Material 1.

Damping 2

- I In the Physics toolbar, click 🕞 Attributes and choose Damping.
- 2 Select Domain 2 only.
- 3 In the Settings window for Damping, locate the Damping Settings section.
- 4 From the Damping type list, choose Isotropic loss factor.
- **5** From the η_s list, choose **User defined**. In the associated text field, type 0.005.

HEAT TRANSFER IN SOLIDS (HT)

In the Model Builder window, under Component I (compl) click Heat Transfer in Solids (ht).

Temberature I

- I In the Physics toolbar, click **Boundaries** and choose **Temperature**.
- 2 Select Boundaries 1 and 4 only.

Heat Flux I

- I In the Physics toolbar, click **Boundaries** and choose **Heat Flux**.
- 2 In the Settings window for Heat Flux, locate the Heat Flux section.
- 3 From the Flux type list, choose Convective heat flux.
- **4** In the *h* text field, type 5.
- **5** Select Boundaries 2, 3, 5, and 7–9 only.

Heat Source 1

- I In the Physics toolbar, click **Domains** and choose **Heat Source**.
- 2 In the Settings window for Heat Source, locate the Domain Selection section.
- 3 From the Selection list, choose All domains.

4 Locate the **Heat Source** section. From the Q_0 list, choose Total power dissipation density (solid).

This choice models the heat generated by the vibrations in the structure.

DEFINITIONS

Maximum I (maxobl)

- I In the Definitions toolbar, click // Nonlocal Couplings and choose Maximum. Add a maximum operator to enable the calculation of maximum temperature after computation.
- 2 In the Settings window for Maximum, locate the Source Selection section.
- 3 From the Selection list, choose All domains.

MESH I

- I In the Model Builder window, under Component I (compl) click Mesh I.
- 2 In the Settings window for Mesh, locate the Physics-Controlled Mesh section.
- 3 From the Element size list, choose Extra fine.

Swept I

- I In the Mesh toolbar, click A Swept.
- 2 In the Settings window for Swept, click **Build All**.

STUDY I

Steb 1: Time Debendent

- I In the Model Builder window, under Study I click Step I: Time Dependent.
- 2 In the Settings window for Time Dependent, locate the Study Settings section.
- 3 In the Output times text field, type range (0,0.05,2). Before computing the solution, generate the default plots.
- 4 In the Model Builder window, right-click Study I and choose Get Initial Value for Step.

RESULTS

Volume 1

- I In the Model Builder window, expand the Temperature (ht) node, then click Volume I.
- 2 In the Settings window for Volume, locate the Expression section.
- 3 In the Expression text field, type T-293.15.

STUDY I

Step 1: Time Dependent

- I In the Model Builder window, under Study I click Step I: Time Dependent.
- 2 In the Settings window for Time Dependent, click to expand the Results While Solving section.
- **3** Select the **Plot** check box.

Solver Configurations

In the Model Builder window, expand the Study I>Solver Configurations node.

Solution I (soll)

- I In the Model Builder window, expand the Study I>Solver Configurations>Solution I (soll) node, then click Time-Dependent Solver I.
- 2 In the Settings window for Time-Dependent Solver, click to expand the Time Stepping section.
- 3 From the Steps taken by solver list, choose Intermediate.
 - You need to enable complex values because they are used in the solid mechanics equations, which you manually reconfigured for the frequency-domain analysis.
- 4 Click to expand the Advanced section. Select the Allow complex numbers check box.
- 5 In the Home toolbar, click **Compute**.

RESULTS

Temperature (ht)

The computed solution should closely resemble that shown in Figure 2.

Volume 1

- I In the Model Builder window, expand the Stress (solid) node, then click Volume I.
- 2 In the Settings window for Volume, locate the Expression section.
- 3 From the Unit list, choose MPa.
- 4 In the Stress (solid) toolbar, click Plot.

Temperature Increase

- I In the Home toolbar, click (Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Temperature Increase in the Label text field.

Global I

- I In the Temperature Increase toolbar, click 🕞 Global.
- 2 In the Settings window for Global, locate the y-Axis Data section.
- **3** In the table, enter the following settings:

Expression	Unit	Description
maxop1(T-293.15[K])	K	Temperature increase

4 Click to expand the **Legends** section. Clear the **Show legends** check box.
