Vanadium Redox Flow Battery

Introduction

Redox flow batteries store the energy in the liquid electrolytes, pumped through the cell and stored in external tanks, rather than in the porous electrodes as for conventional batteries. This approach offers interesting solutions for low-cost energy storage, load leveling and power peak shaving.

The vanadium redox flow battery uses two different electrolyte solutions, one for the negative side of the cell and another for the positive side. The two solutions are kept separated in the cell by the use of an ion-exchange membrane that allows for transport of ions (primarily protons) between the two cell compartments. The principle of the vanadium redox flow battery is illustrated in Figure 1.

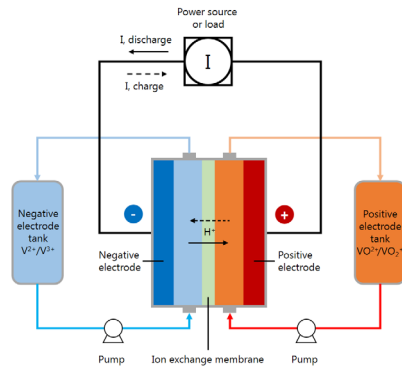

Figure 1: Schematic of a vanadium redox flow battery system.

This example demonstrates how to build a model consisting of two different cell compartments, with different ion compositions and electrode reactions, separated by an ion-exchange membrane. The model is a modified version of published works (Ref. 1 and Ref. 2).

See also the Application Libraries example Soluble Lead–Acid Redox Flow Battery for how to make a transient flow battery model by coupling the cell model to mass balances for the external storage tanks.

Model Definition

The cell geometry is shown in Figure 2. The model contains three domains, a negative porous electrode (4 mm thick), an ion-exchange membrane (203 μm thick) and a positive porous electrode (4 mm thick). The cell is 35 mm high.

Figure 2: Model geometry. Three domains: negative electrode, membrane, positive electrode.

Each side of the cell is fed with an electrolyte containing sulfuric acid and a vanadium redox couple (see below), flowing through the porous electrodes. The liquid enters the cell from bottom at a constant velocity in the y direction, corresponding to a flow rate of 30 ml/ min at cell depth of 28.5 mm.

The left electrode is grounded, and the current leaves the cell over the rightmost boundary at an average current density of 100 mA/cm^2.
The models solves for a stationary case with a given set of inlet concentrations.

LIQUID ELECTROLYTE SPECIES AND ELECTRODE REACTIONS

The negative electrolyte contains the following ions:

- H^+
- HSO_4^-
- SO_4^{2-}
- V^{3+}
- V^{2+}

The negative electrode reaction is:

$$V^{3+} + e^- \leftrightarrow V^{2+}$$

The equilibrium potential for this reaction is calculated using Nernst equation according to

$$E_{\text{eq, neg}} = E_{0,\text{ neg}} + \frac{RT}{F}\ln\left(\frac{a_{V^{3+}}}{a_{V^{2+}}}\right)$$

where $E_{0,\text{ neg}}$ is the reference potential for the electrode reaction (SI unit: V), a_i is the chemical activity of species i (dimensionless), R is the molar gas constant (8.31 J/(mol·K)), T is the cell temperature (SI unit: K), and F is Faraday's constant (96,485 s·A/mol).

A Butler–Volmer type of kinetics expression is used for the negative electrode reaction according to:

$$i_{\text{neg}} = Ai_{0,\text{ neg}}\left(\exp\left(\left(\frac{(1-\alpha_{\text{neg}})F\eta_{\text{neg}}}{RT}\right) - \exp\left(\frac{-\alpha_{\text{neg}}F\eta_{\text{neg}}}{RT}\right)\right)\right)$$

$$i_{0,\text{ neg}} = Fk_{\text{neg}}(a_{V^{2+}})^{1-\alpha_{\text{neg}}}(a_{V^{3+}})^{\alpha_{\text{neg}}}$$

where A is the specific surface area (SI unit: m^2/m^3) of the porous electrode, α_{neg} the transfer coefficient (dimensionless), k_{neg} the rate constant.

The overpotential, η_{neg} (SI unit: V), is defined as

$$\eta = \phi_s - \phi_l - E_{\text{eq}}$$

where ϕ_s is the electric potential of the solid phase of the electrode (SI unit: V) and ϕ_l the electrolyte potential (SI unit: V).

The positive electrolyte contains the following ions:

- H^+
- HSO_4^-
- SO_4^{2-}
- VO^{2+}
- VO_2^+

The positive electrode reaction is:

$$VO_2^+ + e^- + 2H^+ \leftrightarrow VO^{2+} + H_2O$$

with the equilibrium potential calculated according to:

$$E_{\text{eq, pos}} = E_{0,\text{pos}} + \frac{RT}{F}\ln\left(\frac{a_{\text{VO}_2^+}(a_{\text{H}^+})^2}{a_{\text{VO}^{2+}}}\right)$$

$$i_{\text{pos}} = A i_{0,\text{pos}}\left(\exp\left(\left(\frac{(1-\alpha_{\text{pos}})F\eta_{\text{pos}}}{RT}\right) - \exp\left(\frac{-\alpha_{\text{pos}}F\eta_{\text{pos}}}{RT}\right)\right)\right)$$
$$i_{0,\text{pos}} = F k_{\text{pos}}(a_{\text{VO}^{2+}})^{1-\alpha_{\text{pos}}}(a_{\text{VO}_2^+})^{\alpha_{\text{pos}}}$$

The ion exchange membrane accounts for transport of the following ions:

- H^+
- HSO_4^-
- SO_4^{2-}
- V^{3+}
- V^{2+}
- VO^{2+}
- VO_2^+

SULFURIC ACID DISSOCIATION

The first dissociation step of sulfuric acid is assumed to be complete

$$H_2SO_4 \rightarrow H^+ + HSO_4^-$$

whereas the second step

$$HSO_4^- \leftrightarrow H^+ + SO_4^{2-}$$

is described using a dissociation source term, r_d:

$$r_d = k_d\left(\frac{a_{\text{H}^+} - a_{\text{HSO}_4^-}}{a_{\text{H}^+} + a_{\text{HSO}_4^-}} - \beta\right)$$

where k_d is a rate parameter, and β the degree of dissociation.

ION TRANSPORT EQUATIONS

In this model the Nernst–Planck equations are used for ion flux and charge transport by which the following equation describes the molar flux of species i, $\mathbf{N}_i$, due to diffusion, migration, and convection:

$$\mathbf{N}_i = -D_i \nabla c_i - z_i u_{\text{mob},i} F c_i \nabla \phi_l + c_i \mathbf{u}$$

The first term is the diffusion flux, D_i is the diffusion coefficient (SI unit: m^2/s). The migration term consists of the species charge number z_i, the species mobility $u_{\text{mob},i}$ (SI unit: s·mol/kg) and the electrolyte potential (ϕ_l). In the convection term, $\mathbf{u}$ denotes the fluid velocity vector (SI unit: m/s).

The electrolyte current density is calculated using Faraday's law by summing up the contributions from the molar fluxes, multiplied by the species charges, with the observation that the convective term vanishes due to the electroneutrality condition (see the theory for the Tertiary Current Distribution, Nernst–Planck interface):

$$\mathbf{i}_l = F \sum_{i=1}^{n} z_i(-D_i \nabla c_i - z_i u_{\text{m},i} F c_i \nabla \phi_l) \tag{1}$$

The conservation of charge is then used to calculate the electrolyte potential.

$$\nabla \cdot \mathbf{i}_l = F \sum_{i=1}^{n} z_i R_i$$

where the R_i terms are the reaction sources due the porous electrode reactions.

This model uses Equation 1 when solving for the electrolyte potential in the porous electrodes through the Tertiary Current Distribution, Nernst–Planck interface.

In the negative and positive porous electrode domains, where there is free electrolyte present, the concentrations for all the ions are of the same order of magnitude, and the gradients of c_i are not negligible. The membrane, however, consists of a polymer electrolyte, with additional negative ions fixed in the polymer matrix, implying that the concentration for this species is constant. In the ion-exchange membrane domain, a fixed space charge, ρ_{fix}, is added while calculating the sum of charges in the electroneutrality condition:

$$\rho_{\text{fix}} + F \sum_{i=1}^{n} z_i c_i = 0 \qquad (2)$$

The fixed space charge is prescribed in terms of the membrane charge concentration which is varied using an auxiliary sweep in this model.

MEMBRANE — POROUS ELECTRODE BOUNDARY CONDITIONS

Donnan Conditions
The boundary conditions at the boundaries between the membrane and the porous electrode domains are set up in the following way.

For species existing on both sides of the membrane-electrode, we have the following relation between the potentials and the concentrations:

$$\phi_{l,m} = \phi_{l,e} - \frac{RT}{z_i F} \ln\left(\frac{c_{i,m}}{c_{i,e}}\right) \qquad (3)$$

where $c_{i,m}$ is the species concentration in the membrane, and $c_{i,e}$ the species concentration in the free electrolyte and z_i the corresponding charge. The potential shift caused by Equation 3 is called Donnan potential (Ref. 3). The Ion Exchange Membrane Boundary feature in the Tertiary Current Distribution, Nernst–Planck interface is used to define the Donnan conditions.

Self-discharge Reactions
At the membrane-positive electrode boundary, the V^{3+} and V^{2+} are assumed to be immediately oxidized according to
$$V^{2+} \rightarrow V^{3+} + e^{-}$$

and

$$V^{3+} + 2H_2O \rightarrow VO^{2+} + 2H^{+} + e^{-}$$
so that

$$c_{V^{3+}} = c_{V^{2+}} = 0 \qquad (4)$$

Correspondingly, the VO^{2+} and VO_2^{+} concentrations are assumed to be zero at the membrane–negative electrode boundaries:

$$c_{\text{VO}^{2+}} = c_{\text{VO}_2^+} = 0 \tag{5}$$

as a result of the reduction reactions

$$\text{VO}_2^+ + e^- + 2\,\text{H}^+ \rightarrow \text{VO}^{2+} + \text{H}_2\text{O}$$

and

$$\text{VO}^{2+} + 2\,\text{H}^+ + e^- \rightarrow \text{V}^{3+} + 2\,\text{H}_2\text{O}$$

the fast oxidation/reduction reactions are implemented using the Fast Irreversible Reaction kinetics type of the Electrode Surface node.

Results and Discussion

Figure 3 shows the concentration of the V^{3+} and the VO^{2+} ions in the porous electrodes for the membrane charge concentration of -1900 mol/m^3. The ion concentration for these species is higher toward the current collectors and toward the outlets.

Figure 3: Concentration (mol/m^3) of the V^{3+} (left compartment) and the VO^{2+} (right compartment) ions for a membrane charge concentration of -1900 mol/m^3.

Figure 4 shows the concentration of the V^{2+} and the VO_2^+ ions for the membrane charge concentration of -1900 mol/m^3. Depletion occurs along the flow direction and also toward both the current collector and membrane sides of the electrodes.

Figure 4: Concentration (mol/m^3) of the V^{2+} (left compartment) and the VO_2^+ (right compartment) ions for a membrane charge concentration of -1900 mol/m^3.

Figure 5 shows the electrolyte potential for the membrane charge concentration of -1900 mol/m^3, which decreases toward the positive current collector.
Figure 5: Electrolyte potential for a membrane charge concentration of $-1900 \ mol/m^3$.

Figure 6 shows a cut line plot of the electrolyte potential at half the cell height. The Donnan potential shifts at the membrane boundaries are clearly visible in the figure.
Figure 6: Electrolyte potential along a horizontal line placed at $y = h_{cell}/2$.

Figure 7 shows the electrode reaction source at half the cell height. The maximum is located toward the current collectors, with a minimum located in the middle of the electrodes. The reason for this phenomena is the similar conductivities of both phases (electrolyte and electrode) of the porous electrodes.
Figure 7: Electrode reaction source in the porous electrodes along a horizontal line placed at
$y = h_{cell}/2$.

Figure 8 shows the logarithm of the absolute rate of the dissociation reaction. Except from very close to the boundaries, the rates are generally very low, indicating that equilibrium is reached swiftly.
Figure 8: Sulfuric acid dissociation rate (mol/(m^3s)) for a membrane charge concentration of −1900 mol/m^3).

Figure 9 shows the local concentrations of the sulfuric acid species at half the cell height. In the electrodes, gradients are only seen close to the membrane; this is due to the influx and outflux of protons at the membrane boundaries in combination with the acid dissociation reaction.
Figure 9: Sulfuric acid species along a horizontal line placed at $y = h_{cell}/2$.

Figure 10 shows the local concentrations of the vanadium species at half the cell height. The highest gradients of vanadium species is seen to be located in the ion exchange membrane.

Figure 10: Vanadium species along a horizontal line placed at $y = h_{cell}/2$.

Figure 11 shows the local fluxes of the sulfuric acid species at half the cell height. The fluxes are seen to be the maximum close to the ion exchange membrane.

Figure 11: Sulfuric acid species fluxes along a horizontal line placed at $y = h_{cell}/2$.

Modeling Instructions

From the **File** menu, choose **New**.

In the **New** window, click ◈ **Model Wizard**.

MODEL WIZARD

1 In the **Model Wizard** window, click 🔵 **2D**.

Add three Tertiary Current Distribution, Nernst Planck interfaces to your model. They will represent the physics for the two porous electrodes and the membrane.

2 In the **Select Physics** tree, select **Electrochemistry>Tertiary Current Distribution, Nernst-Planck>Tertiary, Electroneutrality (tcd)**.

3 Click **Add**.

4 In the **Number of species** text field, type 5.

5 In the **Concentrations (mol/m³)** table, enter the following settings:

cSO4_neg
cHSO4_neg
cH_neg
cV2
cV3

6 In the **Electrolyte potential (V)** text field, type `phil_neg`.

7 In the **Electric potential (V)** text field, type `phis_neg`.

8 In the **Select Physics** tree, select **Electrochemistry>Tertiary Current Distribution, Nernst-Planck>Tertiary, Electroneutrality (tcd)**.

9 Click **Add**.

10 In the **Number of species** text field, type 7.

11 In the **Concentrations (mol/m³)** table, enter the following settings:

cSO4_mem
cHSO4_mem
cH_mem
cV2_mem
cV3_mem
cV4_mem
cV5_mem

12 In the **Electrolyte potential (V)** text field, type phil_mem.

13 In the **Electric potential (V)** text field, type phis_mem.

14 In the **Select Physics** tree, select **Electrochemistry>Tertiary Current Distribution, Nernst-Planck>Tertiary, Electroneutrality (tcd)**.

15 Click **Add**.

16 In the **Number of species** text field, type 5.

17 In the **Concentrations (mol/m³)** table, enter the following settings:

cSO4_pos
cHSO4_pos
cH_pos
cV4
cV5

18 In the **Electrolyte potential (V)** text field, type phil_pos.

19 In the **Electric potential (V)** text field, type phis_pos.

20 Click ➡ **Study**.

21 In the **Select Study** tree, select **Preset Studies for Selected Physics Interfaces> Stationary with Initialization**.

22 Click ☑ **Done**.

GLOBAL DEFINITIONS

Add the model parameters from a text file.

Parameters 1

1 In the **Model Builder** window, under **Global Definitions** click **Parameters 1**.

2 In the **Settings** window for **Parameters**, locate the **Parameters** section.

3 Click ![folder icon] **Load from File**.

4 Browse to the model's Application Libraries folder and double-click the file
v_flow_battery_parameters.txt.

GEOMETRY I

Draw the geometry as a union of three rectangles (the two porous electrodes and the membrane domains).

Negative Electrode

1 In the **Geometry** toolbar, click ![rectangle icon] **Rectangle**.

2 In the **Settings** window for **Rectangle**, locate the **Size and Shape** section.

3 In the **Width** text field, type L_e.

4 In the **Height** text field, type H_cell.

5 Locate the **Selections of Resulting Entities** section. Select the **Resulting objects selection** check box.

6 In the **Label** text field, type Negative Electrode.

Membrane

1 In the **Geometry** toolbar, click ![rectangle icon] **Rectangle**.

2 In the **Settings** window for **Rectangle**, locate the **Size and Shape** section.

3 In the **Width** text field, type L_m.

4 In the **Height** text field, type H_cell.

5 Locate the **Position** section. In the **x** text field, type L_e.

6 Locate the **Selections of Resulting Entities** section. Select the **Resulting objects selection** check box.

7 In the **Label** text field, type Membrane.

Positive Electrode

1 In the **Geometry** toolbar, click ![rectangle icon] **Rectangle**.

2 In the **Settings** window for **Rectangle**, locate the **Size and Shape** section.

3 In the **Width** text field, type L_e.

4 In the **Height** text field, type H_cell.

5 Locate the **Position** section. In the **x** text field, type L_e+L_m.

6 Locate the **Selections of Resulting Entities** section. Select the **Resulting objects selection** check box.

7 In the **Label** text field, type Positive Electrode.

8 Click ⬛ **Build All Objects**.

9 Click the ⊹ **Zoom Extents** button in the **Graphics** toolbar.

Compare the geometry with Figure 2.
DEFINITIONS

Add domain specific variables.

Negative Electrode Variables

1 In the **Home** toolbar, click $a=$ **Variables** and choose **Local Variables**.

2 In the **Settings** window for **Variables**, locate the **Geometric Entity Selection** section.

3 From the **Geometric entity level** list, choose **Domain**.

4 From the **Selection** list, choose **Negative Electrode**.

5 Locate the **Variables** section. Click 📂 **Load from File**.

6 Browse to the model's Application Libraries folder and double-click the file
v_flow_battery_negative_variables.txt.

7 In the **Label** text field, type Negative Electrode Variables.

Membrane Variables

1 In the **Home** toolbar, click $a=$ **Variables** and choose **Local Variables**.

2 In the **Settings** window for **Variables**, locate the **Geometric Entity Selection** section.

3 From the **Geometric entity level** list, choose **Domain**.

4 From the **Selection** list, choose **Membrane**.

5 Locate the **Variables** section. Click 📂 **Load from File**.

6 Browse to the model's Application Libraries folder and double-click the file
v_flow_battery_membrane_variables.txt.

7 In the **Label** text field, type Membrane Variables.

Positive Electrode Variables

1 In the **Home** toolbar, click $a=$ **Variables** and choose **Local Variables**.

2 In the **Settings** window for **Variables**, locate the **Geometric Entity Selection** section.

3 From the **Geometric entity level** list, choose **Domain**.

4 From the **Selection** list, choose **Positive Electrode**.

5 Locate the **Variables** section. Click 📂 **Load from File**.

6 Browse to the model's Application Libraries folder and double-click the file
v_flow_battery_positive_variables.txt.

7 In the **Label** text field, type Positive Electrode Variables.

TERTIARY CURRENT DISTRIBUTION, NERNST-PLANCK (NEGATIVE)

Now start defining the current distribution models. Start with the negative porous electrode.

1 In the **Model Builder** window, under **Component 1 (comp1)** click **Tertiary Current Distribution, Nernst-Planck (tcd)**.

2 In the **Settings** window for **Tertiary Current Distribution, Nernst-Planck**, type Tertiary Current Distribution, Nernst-Planck (Negative) in the **Label** text field.

3 Locate the **Domain Selection** section. From the **Selection** list, choose **Negative Electrode**.

4 Locate the **Out-of-Plane Thickness** section. In the d_z text field, type wCell.

Species Charges 1

1 In the **Model Builder** window, under **Component 1 (comp1)>Tertiary Current Distribution, Nernst-Planck (Negative) (tcd)** click **Species Charges 1**.

2 In the **Settings** window for **Species Charges**, locate the **Charge** section.

3 In the $z_{cSO4neg}$ text field, type -2.

4 In the $z_{cHSO4neg}$ text field, type -1.

5 In the z_{cHneg} text field, type 1.

6 In the z_{cV2} text field, type 2.

7 In the z_{cV3} text field, type 3.

Porous Electrode 1

1 In the **Physics** toolbar, click ⬤ **Domains** and choose **Porous Electrode**.

2 In the **Settings** window for **Porous Electrode**, locate the **Domain Selection** section.

3 From the **Selection** list, choose **Negative Electrode**.

4 Locate the **Convection** section. Specify the **u** vector as

0	x
v	y

5 Locate the **Electrode Current Conduction** section. From the σ_s list, choose **User defined**. In the associated text field, type sigma_e.

6 Locate the **Diffusion** section. In the $D_{cSO4neg}$ text field, type DSO4.

7 In the $D_{cHSO4neg}$ text field, type DHSO4.

8 In the D_{cHneg} text field, type DH.

9 In the D_{cV2} text field, type DV2.

10 In the D_{cV3} text field, type DV3.

11 Locate the **Porous Matrix Properties** section. In the ε_l text field, type epsilon.

12 Locate the **Effective Transport Parameter Correction** section. From the **Electrical conductivity** list, choose **No correction**.

Porous Electrode Reaction 1

1 In the **Model Builder** window, click **Porous Electrode Reaction 1**.

2 In the **Settings** window for **Porous Electrode Reaction**, locate the **Stoichiometric Coefficients** section.

3 In the ν_{cV2} text field, type 1.

4 In the ν_{cV3} text field, type -1.

5 Locate the **Equilibrium Potential** section. In the $E_{eq,ref}(T)$ text field, type E0_neg.

6 Locate the **Electrode Kinetics** section. In the $i_{0,ref}(T)$ text field, type i0ref_neg.

7 In the α_a text field, type alpha_neg.

8 Locate the **Active Specific Surface Area** section. In the a_v text field, type a.

Reactions 1

1 In the **Physics** toolbar, click ⬤ **Domains** and choose **Reactions**.

2 In the **Settings** window for **Reactions**, locate the **Domain Selection** section.

3 From the **Selection** list, choose **Negative Electrode**.

4 Locate the **Reaction Rates** section. In the $R_{cSO4neg}$ text field, type -rd.

5 In the $R_{cHSO4neg}$ text field, type rd.

6 In the R_{cHneg} text field, type -rd.

Electric Ground 1

1 In the **Physics** toolbar, click ⬭ **Boundaries** and choose **Electric Ground**.

2 Select Boundary 1 only.

Inflow 1

1 In the **Physics** toolbar, click ⬭ **Boundaries** and choose **Inflow**.

2 Select Boundary 2 only.

3 In the **Settings** window for **Inflow**, locate the **Concentration** section.

4 In the $c_{0,cHSO4neg}$ text field, type cHSO4_0_neg.

5 In the $c_{0,cHneg}$ text field, type cH_0_neg.

6 In the $c_{0,cV2}$ text field, type cV2_0.

7 In the $c_{0,cV3}$ text field, type cV3_0.

8 Locate the **Boundary Condition Type** section. From the list, choose **Flux (Danckwerts)**.

Outflow 1

1 In the **Physics** toolbar, click ⬭ **Boundaries** and choose **Outflow**.

2 Select Boundary 3 only.

Ion Exchange Membrane Boundary 1

The electrolyte potential and species concentration in the membrane and in the porous electrodes are coupled by the use of Donnan potential expression on the boundary between the membrane and the porous electrode.

1 In the **Physics** toolbar, click ⬭ **Boundaries** and choose **Ion Exchange Membrane Boundary**.

2 Select Boundary 4 only.

3 In the **Settings** window for **Ion Exchange Membrane Boundary**, locate the **Ion Exchange Membrane Boundary** section.

4 From the ϕ_m list, choose **Electrolyte potential (tcd2)**.

5 From the **Ion exchange membrane transport model** list, choose **Multiple ions**.

6 In the $c_{mem,cSO4neg}$ text field, type cSO4_mem.

7 Select the **Species cHSO4_neg** check box.

8 In the $c_{mem,cHSO4neg}$ text field, type cHSO4_mem.

9 Select the **Species cH_neg** check box.

10 In the $c_{mem,cHneg}$ text field, type cH_mem.

11 Select the **Species cV2** check box.

12 In the $c_{mem,cV2}$ text field, type cV2_mem.

13 Select the **Species cV3** check box.

14 In the $c_{mem,cV3}$ text field, type cV3_mem.

Electrode Current Density 1

Add the electrode current density for the current balance.

1 In the **Physics** toolbar, click ⬭ **Boundaries** and choose **Electrode Current Density**.

2 Select Boundary 4 only.

3 In the **Settings** window for **Electrode Current Density**, locate the **Electrode Current Density** section.

4 In the $i_{n,s}$ text field, type `-tcd2.itot`.

Initial Values 1

1 In the **Model Builder** window, click **Initial Values 1**.

2 In the **Settings** window for **Initial Values**, locate the **Initial Values** section.

3 In the $cHSO4_{neg}$ text field, type `cHSO4_0_neg`.

4 In the cH_{neg} text field, type `cH_0_neg`.

5 In the $cV2$ text field, type `cV2_0`.

6 In the $cV3$ text field, type `cV3_0`.

TERTIARY CURRENT DISTRIBUTION, NERNST-PLANCK (ION EXCHANGE MEMBRANE)

Now set up the Tertiary Current Distribution model for the membrane.

1 In the **Model Builder** window, under **Component 1 (comp1)** click **Tertiary Current Distribution, Nernst-Planck 2 (tcd2)**.

2 In the **Settings** window for **Tertiary Current Distribution, Nernst-Planck**, type `Tertiary Current Distribution, Nernst-Planck (Ion Exchange Membrane)` in the **Label** text field.

3 Locate the **Domain Selection** section. From the **Selection** list, choose **Membrane**.

4 Locate the **Out-of-Plane Thickness** section. In the d_z text field, type `wCell`.

Species Charges 1

1 In the **Model Builder** window, under **Component 1 (comp1)>Tertiary Current Distribution, Nernst-Planck (Ion Exchange Membrane) (tcd2)** click **Species Charges 1**.

2 In the **Settings** window for **Species Charges**, locate the **Charge** section.

3 In the $z_{cSO4mem}$ text field, type `-2`.

4 In the $z_{cHSO4mem}$ text field, type `-1`.

5 In the z_{cHmem} text field, type `1`.

6 In the z_{cV2mem} text field, type `2`.

7 In the z_{cV3mem} text field, type `3`.

8 In the z_{cV4mem} text field, type `2`.

9 In the z_{cV5mem} text field, type `1`.

Ion Exchange Membrane 1

1 In the **Physics** toolbar, click ⬤ **Domains** and choose **Ion Exchange Membrane**.

2 In the **Settings** window for **Ion Exchange Membrane**, locate the **Domain Selection** section.

3 From the **Selection** list, choose **Membrane**.

4 Locate the **Ion Exchange Membrane Properties** section. In the ρ_{fix} text field, type `c_fix* F_const`.

5 Locate the **Diffusion** section. In the $D_{cSO4mem}$ text field, type `DSO4`.

6 In the $D_{cHSO4mem}$ text field, type `DHSO4`.

7 In the D_{cHmem} text field, type `DH`.

8 In the D_{cV2mem} text field, type `DV2`.

9 In the D_{cV3mem} text field, type `DV3`.

10 In the D_{cV4mem} text field, type `DV4`.

11 In the D_{cV5mem} text field, type `DV5`.

12 Locate the **Porous Matrix Properties** section. In the ε_l text field, type `0.1`.

Reactions 1

1 In the **Physics** toolbar, click ⬤ **Domains** and choose **Reactions**.

2 In the **Settings** window for **Reactions**, locate the **Domain Selection** section.

3 From the **Selection** list, choose **Membrane**.

4 Locate the **Reaction Rates** section. In the $R_{cSO4mem}$ text field, type `-rd`.

5 In the $R_{cHSO4mem}$ text field, type `rd`.

6 In the R_{cHmem} text field, type `-rd`.

Electrode Surface 1

1 In the **Physics** toolbar, click ⬛ **Boundaries** and choose **Electrode Surface**.

2 Select Boundary 4 only.

Electrode Reaction 1

1 In the **Model Builder** window, click **Electrode Reaction 1**.

2 In the **Settings** window for **Electrode Reaction**, locate the **Stoichiometric Coefficients** section.

3 In the ν_{cHmem} text field, type `-2`.

4 In the ν_{cV3mem} text field, type `1`.

5 In the ν_{cV4mem} text field, type `-1`.

6 Locate the **Equilibrium Potential** section. From the E_{eq} list, choose **User defined**. Locate the **Electrode Kinetics** section. From the **Kinetics expression type** list, choose **Fast irreversible electrode reaction**.

7 From the c_{lim} list, choose **cV4_mem**.

Electrode Surface 1

In the **Model Builder** window, click **Electrode Surface 1**.

Electrode Reaction 2

1 In the **Physics** toolbar, click ⬛ **Attributes** and choose **Electrode Reaction**.

2 In the **Settings** window for **Electrode Reaction**, locate the **Stoichiometric Coefficients** section.

3 In the ν_{cHmem} text field, type -2.

4 In the ν_{cV4mem} text field, type 1.

5 In the ν_{cV5mem} text field, type -1.

6 Locate the **Equilibrium Potential** section. From the E_{eq} list, choose **User defined**. Locate the **Electrode Kinetics** section. From the **Kinetics expression type** list, choose **Fast irreversible electrode reaction**.

7 From the c_{lim} list, choose **cV5_mem**.

Electrode Surface 2

1 In the **Physics** toolbar, click ⬛ **Boundaries** and choose **Electrode Surface**.

2 Select Boundary 7 only.

Electrode Reaction 1

1 In the **Model Builder** window, click **Electrode Reaction 1**.

2 In the **Settings** window for **Electrode Reaction**, locate the **Equilibrium Potential** section.

3 From the E_{eq} list, choose **User defined**. Locate the **Electrode Kinetics** section. From the **Kinetics expression type** list, choose **Fast irreversible electrode reaction**.

4 From the c_{lim} list, choose **cV2_mem**.

5 Locate the **Stoichiometric Coefficients** section. In the ν_{cHmem} text field, type -2.

6 In the ν_{cV3mem} text field, type 1.

7 In the ν_{cV4mem} text field, type -1.

Electrode Surface 2

In the **Model Builder** window, click **Electrode Surface 2**.

Electrode Reaction 2

1 In the **Physics** toolbar, click ⬛ **Attributes** and choose **Electrode Reaction**.

2 In the **Settings** window for **Electrode Reaction**, locate the **Equilibrium Potential** section.

3 From the E_{eq} list, choose **User defined**. Locate the **Electrode Kinetics** section. From the **Kinetics expression type** list, choose **Fast irreversible electrode reaction**.

4 From the c_{lim} list, choose **cV3_mem**.

5 Locate the **Stoichiometric Coefficients** section. In the ν_{cV2mem} text field, type 1.

6 In the ν_{cV3mem} text field, type -1.

Initial Values 1

1 In the **Model Builder** window, under **Component 1 (comp1)>Tertiary Current Distribution, Nernst-Planck (Ion Exchange Membrane) (tcd2)** click **Initial Values 1**.

2 In the **Settings** window for **Initial Values**, locate the **Initial Values** section.

3 In the $cHSO4_{mem}$ text field, type (cHSO4_0_pos+cHSO4_0_neg)/2.

4 In the cH_{mem} text field, type (cH_0_pos+cH_0_neg)/2.

5 In the $cV2_{mem}$ text field, type cV2_0/2.

6 In the $cV3_{mem}$ text field, type cV3_0/2.

7 In the $cV4_{mem}$ text field, type cV4_0/2.

8 In the $cV5_{mem}$ text field, type cV5_0/2.

9 In the $phil_{mem}$ text field, type -E0_neg.

TERTIARY CURRENT DISTRIBUTION, NERNST-PLANCK (POSITIVE)

Finish the physics settings by setting up the tertiary current distribution model for the positive porous electrode.

1 In the **Model Builder** window, under **Component 1 (comp1)** click **Tertiary Current Distribution, Nernst-Planck 3 (tcd3)**.

2 In the **Settings** window for **Tertiary Current Distribution, Nernst-Planck**, type Tertiary Current Distribution, Nernst-Planck (Positive) in the **Label** text field.

3 Locate the **Domain Selection** section. From the **Selection** list, choose **Positive Electrode**.

4 Locate the **Out-of-Plane Thickness** section. In the d_z text field, type wCell.

Species Charges 1

1 In the **Model Builder** window, under **Component 1 (comp1)>Tertiary Current Distribution, Nernst-Planck (Positive) (tcd3)** click **Species Charges 1**.

2 In the **Settings** window for **Species Charges**, locate the **Charge** section.

3 In the $z_{cSO4pos}$ text field, type -2.

4 In the $z_{cHSO4pos}$ text field, type -1.

5 In the z_{cHpos} text field, type 1.

6 In the z_{cV4} text field, type 2.

7 In the z_{cV5} text field, type 1.

Porous Electrode 1

1 In the **Physics** toolbar, click ⬤ **Domains** and choose **Porous Electrode**.

2 In the **Settings** window for **Porous Electrode**, locate the **Domain Selection** section.

3 From the **Selection** list, choose **Positive Electrode**.

4 Locate the **Convection** section. Specify the **u** vector as

0	x
v	y

5 Locate the **Electrode Current Conduction** section. From the σ_s list, choose **User defined**. In the associated text field, type sigma_e.

6 Locate the **Diffusion** section. In the $D_{cSO4pos}$ text field, type DSO4.

7 In the $D_{cHSO4pos}$ text field, type DHSO4.

8 In the D_{cHpos} text field, type DH.

9 In the D_{cV4} text field, type DV4.

10 In the D_{cV5} text field, type DV5.

11 Locate the **Porous Matrix Properties** section. In the ε_l text field, type epsilon.

12 Locate the **Effective Transport Parameter Correction** section. From the **Electrical conductivity** list, choose **No correction**.

Porous Electrode Reaction 1

1 In the **Model Builder** window, click **Porous Electrode Reaction 1**.

2 In the **Settings** window for **Porous Electrode Reaction**, locate the **Stoichiometric Coefficients** section.

3 In the ν_{cHpos} text field, type -2.

4 In the ν_{cV4} text field, type 1.

5 In the ν_{cV5} text field, type -1.

6 Locate the **Equilibrium Potential** section. In the $E_{eq,ref}(T)$ text field, type E0_pos.

7 Locate the **Electrode Kinetics** section. In the $i_{0,ref}(T)$ text field, type i0ref_pos.

8 In the α_a text field, type alpha_pos.

9 Locate the **Active Specific Surface Area** section. In the a_v text field, type a.

Reactions 1

1 In the **Physics** toolbar, click ⬤ **Domains** and choose **Reactions**.

2 In the **Settings** window for **Reactions**, locate the **Domain Selection** section.

3 From the **Selection** list, choose **Positive Electrode**.

4 Locate the **Reaction Rates** section. In the $R_{cSO4pos}$ text field, type `-rd`.

5 In the $R_{cHSO4pos}$ text field, type `rd`.

6 In the R_{cHpos} text field, type `-rd`.

Electrode Current 1

1 In the **Physics** toolbar, click ⬬ **Boundaries** and choose **Electrode Current**.

2 In the **Settings** window for **Electrode Current**, locate the **Electrode Current** section.

3 From the list, choose **Average current density**.

4 Select Boundary 10 only.

5 In the $i_{s,average}$ text field, type `i_avg`.

Inflow 1

1 In the **Physics** toolbar, click ⬬ **Boundaries** and choose **Inflow**.

2 Select Boundary 8 only.

3 In the **Settings** window for **Inflow**, locate the **Concentration** section.

4 In the $c_{0,cHSO4pos}$ text field, type `cHSO4_0_pos`.

5 In the $c_{0,cHpos}$ text field, type `cH_0_pos`.

6 In the $c_{0,cV4}$ text field, type `cV4_0`.

7 In the $c_{0,cV5}$ text field, type `cV5_0`.

8 Locate the **Boundary Condition Type** section. From the list, choose **Flux (Danckwerts)**.

Outflow 1

1 In the **Physics** toolbar, click ⬬ **Boundaries** and choose **Outflow**.

2 Select Boundary 9 only.

Ion Exchange Membrane Boundary 1

The boundary condition for the membrane boundary is set as before. The electrolyte potential and species concentration in the membrane and in the porous electrode are coupled by the use of Donnan potential expressions on the boundary between the membrane and the porous electrode.

1 In the **Physics** toolbar, click ⬬ **Boundaries** and choose
Ion Exchange Membrane Boundary.

2 Select Boundary 7 only.

3 In the **Settings** window for **Ion Exchange Membrane Boundary**, locate the **Ion Exchange Membrane Boundary** section.

4 From the ϕ_m list, choose **Electrolyte potential (tcd2)**.

5 From the **Ion exchange membrane transport model** list, choose **Multiple ions**.

6 In the $c_{mem,cSO4pos}$ text field, type cSO4_mem.

7 Select the **Species cHSO4_pos** check box.

8 In the $c_{mem,cHSO4pos}$ text field, type cHSO4_mem.

9 Select the **Species cH_pos** check box.

10 In the $c_{mem,cHpos}$ text field, type cH_mem.

11 Select the **Species cV4** check box.

12 In the $c_{mem,cV4}$ text field, type cV4_mem.

13 Select the **Species cV5** check box.

14 In the $c_{mem,cV5}$ text field, type cV5_mem.

Electrode Current Density 1
Add the electrode current density for the current balance.

1 In the **Physics** toolbar, click ⬭ **Boundaries** and choose **Electrode Current Density**.

2 Select Boundary 7 only.

3 In the **Settings** window for **Electrode Current Density**, locate the **Electrode Current Density** section.

4 In the $i_{n,s}$ text field, type -tcd2.itot.

Initial Values 1

1 In the **Model Builder** window, click **Initial Values 1**.

2 In the **Settings** window for **Initial Values**, locate the **Initial Values** section.

3 In the $cHSO4_{pos}$ text field, type cHSO4_0_pos.

4 In the cH_{pos} text field, type cH_0_pos.

5 In the $cV4$ text field, type cV4_0.

6 In the $cV5$ text field, type cV5_0.

GLOBAL DEFINITIONS

Default Model Inputs
Set up the temperature value used in the entire model.

1 In the **Model Builder** window, under **Global Definitions** click **Default Model Inputs**.

2 In the **Settings** window for **Default Model Inputs**, locate the **Browse Model Inputs** section.

3 In the tree, select **General>Temperature (K) - minput.T**.

4 Find the **Expression for remaining selection** subsection. In the **Temperature** text field, type T.

MESH 1

Create a mapped mesh with higher resolution in the porous electrodes toward the membrane and with a boundary layer mesh at the fluid inlet.

Mapped 1

In the **Mesh** toolbar, click 𝌄 **Mapped**.

Distribution 1

1 Right-click **Mapped 1** and choose **Distribution**.

2 Select Boundaries 5 and 6 only.

3 In the **Settings** window for **Distribution**, locate the **Distribution** section.

4 From the **Distribution type** list, choose **Predefined**.

5 In the **Number of elements** text field, type 20.

6 In the **Element ratio** text field, type 2.

7 Select the **Symmetric distribution** check box.

Distribution 2

1 In the **Model Builder** window, right-click **Mapped 1** and choose **Distribution**.

2 Select Boundaries 2 and 3 only.

3 In the **Settings** window for **Distribution**, locate the **Distribution** section.

4 From the **Distribution type** list, choose **Predefined**.

5 In the **Number of elements** text field, type 40.

6 In the **Element ratio** text field, type 20.

7 Right-click **Distribution 2** and choose **Duplicate**.

Distribution 3

1 In the **Model Builder** window, click **Distribution 3**.

2 In the **Settings** window for **Distribution**, locate the **Boundary Selection** section.

3 Click 🖱 **Clear Selection**.

4 Select Boundaries 8 and 9 only.

5 Locate the **Distribution** section. Select the **Reverse direction** check box.

Distribution 4

1 In the **Model Builder** window, right-click **Mapped 1** and choose **Distribution**.

2 Select Boundaries 1, 4, 7, and 10 only.

3 In the **Settings** window for **Distribution**, locate the **Distribution** section.

4 From the **Distribution type** list, choose **Predefined**.

5 In the **Number of elements** text field, type 40.

**6** In the **Element ratio** text field, type 20.

Boundary Layers 1

In the **Mesh** toolbar, click ▨ **Boundary Layers**.

Boundary Layer Properties

1 In the **Model Builder** window, click **Boundary Layer Properties**.

2 Select Boundaries 2 and 8 only.

3 In the **Settings** window for **Boundary Layer Properties**, click ▦ **Build All**.

Your mesh should now look like this:

Run the model for two values of membrane charge concentration using an auxiliary sweep. The problem is then ready for solving.

1 In the **Model Builder** window, click **Study 1**.

2 In the **Settings** window for **Study**, locate the **Study Settings** section.

3 Clear the **Generate default plots** check box.

Step 2: Stationary

1 In the **Model Builder** window, under **Study 1** click **Step 2: Stationary**.

2 In the **Settings** window for **Stationary**, click to expand the **Study Extensions** section.

3 Select the **Auxiliary sweep** check box.

4 Click ╋ **Add**.

5 In the table, enter the following settings:

Parameter name	Parameter value list	Parameter unit
c_fix ((0[M] used during Current Distribution Initialization, -cHm used after Auxiliary sweep))	0 -cHm	mol/m^3

6 In the **Home** toolbar, click ▬ **Compute**.

RESULTS

Reproduce the plots from the Results and Discussion section in the following way:

2D Plot Group 1

1 In the **Home** toolbar, click 🖼 **Add Plot Group** and choose **2D Plot Group**.

2 In the **Settings** window for **2D Plot Group**, click to expand the **Title** section.

3 From the **Title type** list, choose **None**.

Surface 1

1 Right-click **2D Plot Group 1** and choose **Surface**.

2 In the **Settings** window for **Surface**, locate the **Expression** section.

3 In the **Expression** text field, type cV3.

4 Right-click **Surface 1** and choose **Duplicate**.

Surface 2

1 In the **Model Builder** window, click **Surface 2**.

2 In the **Settings** window for **Surface**, locate the **Expression** section.

3 In the **Expression** text field, type cV4.

4 Click to expand the **Inherit Style** section. From the **Plot** list, choose **Surface 1**.

5 In the **2D Plot Group 1** toolbar, click ⬛ **Plot**.

V3/V4 Species Concentration

1 In the **Model Builder** window, under **Results** click **2D Plot Group 1**.

2 In the **Settings** window for **2D Plot Group**, type V3/V4 Species Concentration in the **Label** text field.

3 Right-click **V3/V4 Species Concentration** and choose **Duplicate**.

V3/V4 Species Concentration 1

Now modify the plot group that was created by the duplicate operation.

Surface 1

1 In the **Model Builder** window, expand the **V3/V4 Species Concentration 1** node, then click **Surface 1**.

2 In the **Settings** window for **Surface**, locate the **Expression** section.

3 In the **Expression** text field, type cV2.

Surface 2

1 In the **Model Builder** window, click **Surface 2**.

2 In the **Settings** window for **Surface**, locate the **Expression** section.

3 In the **Expression** text field, type cV5.

V2/V5 Species Concentration

1 In the **Model Builder** window, click **V3/V4 Species Concentration 1**.

2 In the **V3/V4 Species Concentration 1** toolbar, click ⬛ **Plot**.

3 In the **Settings** window for **2D Plot Group**, type V2/V5 Species Concentration in the **Label** text field.

2D Plot Group 3

In the **Home** toolbar, click ▦ **Add Plot Group** and choose **2D Plot Group**.

Surface 1

1 Right-click **2D Plot Group 3** and choose **Surface**.

2 In the **2D Plot Group 3** toolbar, click ⬛ **Plot**.

Electrolyte potential 2D

1 In the **Model Builder** window, right-click **2D Plot Group 3** and choose **Rename**.

2 In the **Rename 2D Plot Group** dialog box, type Electrolyte potential 2D in the **New label** text field.

3 Click **OK**.

Cut Line 2D 1

1 In the **Results** toolbar, click [icon] **Cut Line 2D**.

2 In the **Settings** window for **Cut Line 2D**, locate the **Line Data** section.

3 In row **Point 1**, set **Y** to H_cell/2.

4 In row **Point 2**, set **X** to L_e*2+L_m and **y** to H_cell/2.

1D Plot Group 4

1 In the **Results** toolbar, click [icon] **1D Plot Group**.

2 In the **Settings** window for **1D Plot Group**, locate the **Data** section.

3 From the **Dataset** list, choose **Cut Line 2D 1**.

4 From the **Parameter selection (c_fix)** list, choose **Last**.

5 Click to expand the **Title** section. From the **Title type** list, choose **None**.

Line Graph 1

1 Right-click **1D Plot Group 4** and choose **Line Graph**.

2 In the **Settings** window for **Line Graph**, click **Replace Expression** in the upper-right corner of the **y-Axis Data** section. From the menu, choose **Component 1 (comp1)>Definitions> Variables>phil - Electrolyte potential (for postprocessing) - V**.

3 In the **1D Plot Group 4** toolbar, click [icon] **Plot**.

Electrolyte potential

1 In the **Model Builder** window, right-click **1D Plot Group 4** and choose **Rename**.

2 In the **Rename 1D Plot Group** dialog box, type Electrolyte potential in the **New label** text field.

3 Click **OK**.

1D Plot Group 5

1 In the **Home** toolbar, click [icon] **Add Plot Group** and choose **1D Plot Group**.

2 In the **Settings** window for **1D Plot Group**, locate the **Title** section.

3 From the **Title type** list, choose **None**.

Line Graph 1

1 Right-click **1D Plot Group 5** and choose **Line Graph**.

2 In the **Settings** window for **Line Graph**, locate the **Data** section.

3 From the **Dataset** list, choose **Cut Line 2D 1**.

4 From the **Parameter selection (c_fix)** list, choose **Last**.

5 Click **Replace Expression** in the upper-right corner of the **y-Axis Data** section. From the menu, choose **Component 1 (comp1)>Tertiary Current Distribution, Nernst-Planck (Negative)>Electrode kinetics>tcd.ivtot - Electrode reaction source - A/m³**.

6 In the **1D Plot Group 5** toolbar, click ⊡ **Plot**.

7 Right-click **Line Graph 1** and choose **Duplicate**.

Line Graph 2

1 In the **Model Builder** window, click **Line Graph 2**.

2 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

3 In the **Expression** text field, type tcd3.ivtot.

4 In the **1D Plot Group 5** toolbar, click ⊡ **Plot**.

Electrode reaction current densities

1 In the **Model Builder** window, right-click **1D Plot Group 5** and choose **Rename**.

2 In the **Rename 1D Plot Group** dialog box, type Electrode reaction current densities in the **New label** text field.

3 Click **OK**.

2D Plot Group 6

In the **Home** toolbar, click 🔳 **Add Plot Group** and choose **2D Plot Group**.

Surface 1

1 Right-click **2D Plot Group 6** and choose **Surface**.

2 In the **Settings** window for **Surface**, locate the **Expression** section.

3 In the **Expression** text field, type log(abs(rd)).

4 In the **2D Plot Group 6** toolbar, click ⊡ **Plot**.

Dissociation rate

1 In the **Model Builder** window, right-click **2D Plot Group 6** and choose **Rename**.

2 In the **Rename 2D Plot Group** dialog box, type Dissociation rate in the **New label** text field.

3 Click **OK**.

1D Plot Group 7

1 In the **Home** toolbar, click 🔳 **Add Plot Group** and choose **1D Plot Group**.

2 In the **Settings** window for **1D Plot Group**, locate the **Data** section.

3 From the **Dataset** list, choose **Cut Line 2D 1**.

4 From the **Parameter selection (c_fix)** list, choose **Last**.

5 Locate the **Title** section. From the **Title type** list, choose **None**.

6 Locate the **Plot Settings** section.

7 Select the **y-axis label** check box. In the associated text field, type Species activity (-).

8 Locate the **Legend** section. From the **Position** list, choose **Middle right**.

Line Graph 1

1 In the **Model Builder** window, expand the **ID Plot Group 7** node.

2 Right-click **ID Plot Group 7** and choose **Line Graph**.

3 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

4 In the **Expression** text field, type aH.

5 Click to expand the **Legends** section. Select the **Show legends** check box.

6 From the **Legends** list, choose **Manual**.

7 In the table, enter the following settings:

Legends
H

8 Right-click **Line Graph 1** and choose **Duplicate**.

Line Graph 2

1 In the **Model Builder** window, click **Line Graph 2**.

2 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

3 In the **Expression** text field, type aHSO4.

4 Locate the **Legends** section. In the table, enter the following settings:

Legends
HSO4

5 Right-click **Line Graph 2** and choose **Duplicate**.

Line Graph 3

1 In the **Model Builder** window, click **Line Graph 3**.

2 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

3 In the **Expression** text field, type aSO4.

4 Locate the **Legends** section. In the table, enter the following settings:

Legends
SO4

Sulfuric acid species

1 In the **Model Builder** window, click **ID Plot Group 7**.

2 In the **ID Plot Group 7** toolbar, click ⬛ **Plot**.

3 In the **Settings** window for **ID Plot Group**, type Sulfuric acid species in the **Label** text field.

ID Plot Group 8

1 In the **Home** toolbar, click 🗖 **Add Plot Group** and choose **ID Plot Group**.

2 In the **Settings** window for **ID Plot Group**, locate the **Data** section.

3 From the **Dataset** list, choose **Cut Line 2D 1**.

4 From the **Parameter selection (c_fix)** list, choose **Last**.

5 Locate the **Title** section. From the **Title type** list, choose **None**.

6 Locate the **Plot Settings** section.

7 Select the **y-axis label** check box. In the associated text field, type Species activity (-).

8 Locate the **Legend** section. From the **Position** list, choose **Middle right**.

Line Graph 1

1 Right-click **ID Plot Group 8** and choose **Line Graph**.

2 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

3 In the **Expression** text field, type aV2.

4 Locate the **Legends** section. Select the **Show legends** check box.

5 From the **Legends** list, choose **Manual**.

6 In the table, enter the following settings:

Legends
V2

7 Right-click **Line Graph 1** and choose **Duplicate**.

Line Graph 2

1 In the **Model Builder** window, click **Line Graph 2**.

2 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

3 In the **Expression** text field, type aV3.

4 Locate the **Legends** section. In the table, enter the following settings:

Legends
V3

5 Right-click **Line Graph 2** and choose **Duplicate**.

Line Graph 3

1 In the **Model Builder** window, click **Line Graph 3**.

2 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

3 In the **Expression** text field, type aV4.

4 Locate the **Legends** section. In the table, enter the following settings:

Legends
V4

5 Right-click **Line Graph 3** and choose **Duplicate**.

Line Graph 4

1 In the **Model Builder** window, click **Line Graph 4**.

2 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

3 In the **Expression** text field, type aV5.

4 Locate the **Legends** section. In the table, enter the following settings:

Legends
V5

V2/V3/V4/V5

1 In the **Model Builder** window, click **ID Plot Group 8**.

2 In the **ID Plot Group 8** toolbar, click ⬛ **Plot**.

3 In the **Settings** window for **ID Plot Group**, type V2/V3/V4/V5 in the **Label** text field.

ID Plot Group 9

1 In the **Home** toolbar, click ⬛ **Add Plot Group** and choose **ID Plot Group**.

2 In the **Settings** window for **ID Plot Group**, locate the **Data** section.

3 From the **Dataset** list, choose **Cut Line 2D 1**.

4 From the **Parameter selection (c_fix)** list, choose **Last**.

5 Locate the **Title** section. From the **Title type** list, choose **None**.

6 Locate the **Plot Settings** section.

7 Select the **y-axis label** check box. In the associated text field, type Flux (A/m²).

Line Graph 1

1 Right-click **ID Plot Group 9** and choose **Line Graph**.

2 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

3 In the **Expression** text field, type Hx*F_const.

4 Locate the **Legends** section. Select the **Show legends** check box.

5 From the **Legends** list, choose **Manual**.

6 In the table, enter the following settings:

Legends
H

7 Right-click **Line Graph 1** and choose **Duplicate**.

Line Graph 2

1 In the **Model Builder** window, click **Line Graph 2**.

2 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

3 In the **Expression** text field, type -HSO4x*F_const.

4 Locate the **Legends** section. In the table, enter the following settings:

Legends
HSO4

5 Right-click **Line Graph 2** and choose **Duplicate**.

Line Graph 3

1 In the **Model Builder** window, click **Line Graph 3**.

2 In the **Settings** window for **Line Graph**, locate the **y-Axis Data** section.

3 In the **Expression** text field, type -2*F_const*SO4x.

4 Locate the **Legends** section. In the table, enter the following settings:

Legends
SO4

Fluxes

1 In the **Model Builder** window, click **1D Plot Group 9**.

2 In the **1D Plot Group 9** toolbar, click ➡ **Plot**.

3 In the **Settings** window for **1D Plot Group**, type Fluxes in the **Label** text field.
